Beyond the genome
Studies of the epigenetic signatures of many healthy and diseased human tissues could provide crucial information to link genetic variation and disease.

Starting on page 313, as well as in several other Nature Publishing Group journals, insights into three fundamental aspects of epigenetics emerge: how the epigenome affects gene expression; how the epigenome changes during stem cell differentiation (that is, during normal development); and how it changes during disease.

The results emphasize the central role of epigenetic information in understanding these processes. Crucially, what emerges is that it is not just one or two types of modification that matter. Biology is rarely that simple. Instead, combinations of modifications predict gene activity in ways that a single type of modification does not.

A causal link between epigenetic changes and disease has so far been hard to establish. Identifying such changes is necessary, however, if we are to understand the underlying disease mechanisms and design targeted treatments. With the new wealth of data, consistent alterations in the epigenetic landscape could identify candidate genes and pathways for further follow-up. And time-course studies of the epigenetics of cell types relevant to a specific disease could indicate whether epigenetic changes have a role in disease progression, or only in its onset.

One reason that it has been difficult to relate some diseases to disruption in DNA function is that many of the key changes occur in poorly understood regions of the genome, usually outside those parts that code for proteins. Epigenetic maps such as those published today should help scientists to navigate this poorly charted landscape. By overlaying these maps, made in relevant cell types, researchers can determine, for example, whether an epigenetic change associated with a given disease lies in a region of the genome that regulates gene activity. If it does, then this overlap provides a possible lead to explore.

Cancer is often called the disease of the genome, but the genome does not exist, or operate, in splendid isolation. Of all diseases, cancer has been linked most unambiguously to epigenetic aberrations. Scientists have long suspected that epigenetic organization affects the genomic location of the mutations that provoke cancer. The new findings suggest that this is true, and they go further: They show that the epigenome of a cancer cell carries a fingerprint of the cell type that originated the cancer. This is crucial information, especially for cancers in complex tissues such as the liver, which cannot presently be traced to their original cell type.

In human disease, the genome and epigenome operate together. Tackling disease using information on the genome alone has been like trying to work with one hand tied behind the back. The new wave of epigenetic data from the other hand, if well not prove all the answers, that it could help researchers decide which questions to ask. ■

Coupling of angiogenesis and osteogenesis by a specific vessel subtype in bone.
 Kusumbe AP¹, Ramasamy SK¹, Adams RH².

Author information

Abstract
 The mammalian skeletal system harbours a hierarchical system of mesenchymal stem cells, osteoprogenitors and osteoblasts sustaining lifelong bone formation. Osteogenesis is indispensable for the homeostatic renewal of bone as well as regenerative fracture healing, but these processes frequently decline in ageing organisms, leading to loss of bone mass and increased fracture incidence. Evidence indicates that the growth of blood vessels in bone and osteogenesis are coupled, but relatively little is known about the underlying cellular and molecular mechanisms. Here we identify a new capillary subtype in the murine skeletal system with distinct morphological, molecular and functional properties. These vessels are found in specific locations, mediate growth of the bone vasculature, generate distinct metabolic and molecular microenvironments, maintain perivascular osteoprogenitors and couple angiogenesis to osteogenesis. The abundance of these vessels and associated osteoprogenitors was strongly reduced in bone from aged animals, and pharmacological reversal of this decline allowed the restoration of bone mass.

Design Thinking Week: Students Improve the Daily Life Experience for People with Illiteracies

On the occasion of the World Literacy Day on September 8 more than 40 young innovators applied their Design Thinking skills in order to make life easier for these people.

Here, the focus was especially on the possibilities of using digital technologies and computers to better the daily obstacles in life of the people concerned.

Under the guidance of the D-School's coaches the teams researched, developed and prototyped - and could present many versatile solutions in the end: e.g. one of the groups came up with an idea for a software program that lets internet browsers read texts, functions and links out loud so that people with reading problems can still use news sites or social networks like Facebook.

Summarization

General annotation (Comments)

Function	<p>Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bcl-2 expression. In cooperation with mitochondrial PPIF is involved in activating oxidative stress-induced necrosis; the function is largely independent of transcription. Induces the transcription of long intergenic non-coding RNA p21 (lincRNA-p21) and lincRNA-Mkn1. LincRNA-p21 participates in TP53-dependent transcriptional repression leading to apoptosis and seem to have to effect on cell-cycle regulation. Implicated in Notch signaling cross-over. Prevents CDK7 kinase activity when associated to CAK complex in response to DNA damage, thus stopping cell cycle progression. Isoform 2 enhances the transactivation activity of isoform 1 from some but not all TP53-inducible promoters. Isoform 4 suppresses transactivation activity and impairs growth suppression mediated by isoform 1. Isoform 7 inhibits isoform 1-mediated apoptosis. Ref.70 Ref.93 Ref.95 Ref.107 Ref.110 Ref.122 Ref.125 Ref.34 Ref.42 Ref.61 Ref.66</p>
Cofactor	<p>Binds 1 zinc ion per subunit.</p>
Subunit structure	<p>Interacts with AXIN1. Probably part of a complex consisting of TP53, HIPK2 and AXIN1 By similarity. Binds DNA as a homotetramer. Interacts with histone acetyltransferases EP300 and methyltransferases HRMT1L2 and CARM1, and recruits them to promoters. In vitro, the interaction of TP53 with cancer-associated/HPV (E6) viral proteins leads to ubiquitination and degradation of TP53 giving a possible model for cell growth regulation. This complex formation requires an additional factor, E6-AP, which stably associates with TP53 in the presence of E6. Interacts (via C-terminus) with TAF1; when TAF1 is part of the TFIID complex. Interacts with ING4; this interaction may be indirect. Found in a complex with CABLES1 and TP73. Interacts with HIPK1, HIPK2, and TP53INP1. Interacts with WWOX. May interact with HCV core protein. Interacts with USP7 and SYVN1. Interacts with HSP90AB1. Interacts with CHD8; leading to recruit histone H1 and prevent transactivation activity By similarity. Interacts with ARMC10, BANP, CDKN2AIP, NUAK1, STK11/LKB1, UHRF2 and E4F1. Interacts with YWHAZ; the interaction enhances TP53 transcriptional activity. Phosphorylation of YWHAZ on 'Ser-58' inhibits this interaction. Interacts (via DNA-binding domain) with MAML1 (via N-terminus). Interacts with MKRN1. Interacts with PML (via C-terminus). Interacts with MDM2; leading to ubiquitination and proteasomal degradation of TP53. Directly interacts with FBXO42; leading to ubiquitination and degradation of TP53. Interacts (phosphorylated at Ser-15 by ATM) with the phosphatase PP2A-PPP2R5C holoenzyme; regulates stress-induced TP53-dependent inhibition of cell proliferation. Interacts with PPP2R2A. Interacts with AURKA, DAXX, BRD7 and TRIM24. Interacts (when monomethylated at Lys-382) with L3MBTL1. Isoform 1 interacts with isoform 2 and with isoform 4. Interacts with GRK5. Binds to the CAK complex (CDK7, cyclin H and MAT1) in response to DNA damage. Interacts with CDK5 in neurons. Interacts with AURKB, SETD2, UHRF2 and NOC2L. Interacts (via N-terminus) with PTK2/FAK1; this promotes ubiquitination by MDM2. Interacts with PTK2B/PYK2; this promotes ubiquitination by MDM2. Interacts with PRKCG. Interacts with PPIF; the association implicates preferentially tetrameric TP53, is induced by oxidative stress and is impaired by cyclosporin A (CsA). Interacts with human cytomegalovirus/HHV-5 protein UL123. Interacts with SNAI1; the interaction induces SNAI1 degradation via MDM2-mediated ubiquitination and inhibits SNAI1-induced cell invasion. Interacts with KAT6A. Interacts with UBC9. Interacts with ZNF385B; the interaction is direct. Interacts (via DNA-binding domain) with ZNF385A; the interaction is direct and enhances p53/TP53 transactivation functions on cell-cycle arrest target genes, resulting in growth arrest. Interacts with ANKRD2. Interacts with RFFL (via RING-type zinc finger); involved in p53/TP53 ubiquitination. Correlation between three-dimensional ultrasound features and pathological prognostic factors in breast cancer

Jun Jiang · Yi-qing Chen · Yi-zhan Xu · Ming-E Chen · Yun-kai Zhu · Wen-bin Guan · Xiao-jin Wang

Received: 13 November 2013 / Rev. recd.: 30 January 2014 / Accepted: 17 February 2014
© European Society of Radiology 2014

Abstract
Objectives To investigate the correlation of three-dimensional (3D) ultrasound features with prognostic factors in invasive ductal carcinoma.
Methods Surgical resection specimens of 85 invasive ductal carcinomas of 85 women who had undergone 3D ultrasound were included. Morphology features and vascularization perfusion on 3D ultrasound were evaluated. Pathologic prognostic factors, including tumour size, histological grade, lymph node status, oestrogen and progesterone receptor status (ER, PR), c-erbB-2 and p53 expression, and microvessel density (MVD) were determined. Correlations of 3D ultrasound features and prognostic factors were analysed.
Results The retraction pattern in the coronal plane had a significant value as an independent predictor of a small tumour size ($P=0.014$), a lower histological grade ($P=0.009$) and positive ER or PR expression status ($P=0.001$, 0.044). The retraction pattern with a hypercholeic ring only existed in low-grade and ER-positive tumours. The presence of the hypercholeic ring strengthened the ability of the retraction pattern to predict a good prognosis of breast cancer. The increased intra-tumour vascularization index (VI, the mean

tumour vascularity) reflected a higher histological grade ($P=0.025$) and had a positive correlation with MVD ($r=0.530$, $P=0.001$).
Conclusions The retraction pattern and histogram indices of VI provided by 3D ultrasound may be useful in predicting prognostic information about breast cancer.
Key Points
• Three-dimensional ultrasound can potentially provide prognostic evaluation of breast cancer.
• The retraction pattern and hypercholeic ring in the coronal plane suggest good prognosis.
• The increased intra-tumour vascularization index reflects a higher histological grade.
• The intra-tumour vascularization index is positively correlated with microvessel density.
Keywords Breast · Neoplasms · Ultrasound · Three-dimensional · Prognostic factors

Introduction

The three strongest prognostic factors in invasive breast cancer are widely accepted to be the size of tumour, histological grade and lymph node stage. The larger tumour size (>2 cm), high nuclear grade, and lymph node-positive status usually predict the aggressive biological behaviour with a high recurrence rate and a low survival rate. In addition, the tumour size and lymph node status greatly influence the choice of operative procedure and the decision to administer neoadjuvant chemotherapy [1, 2].

Biological markers such as oestrogen receptors (ER), progesterone receptors (PR), human epidermal growth factor receptor 2 (c-erbB-2) and the p53 index can also be used for prediction of medical treatment response and patient prognosis. The presence of ER and PR in breast cancer always

determines the application of antihormonal therapy and usually indicates a good prognosis. Expression of c-erbB-2 or the p53 index is a powerful and independent prognostic factor for lymph node metastasis and tumour infiltration [1, 3]. Microvessel density (MVD) is the current reference standard in the characterization of tumour angiogenesis and has been shown to be associated with lymph tumour growth, invasion, metastasis and disease-specific survival [4].
Three-dimensional (3D) ultrasound can afford additional information such as morphology features on the coronal plane and a global appearance of the mass vascularity, which cannot be achieved with conventional ultrasound. Therefore, it has been increasingly considered as an important imaging modality for evaluating primary breast cancer. However, so far, 3D ultrasound has been used mainly to differentiate benign and malignant lesions; no reports address correlations between the 3D ultrasound features and prognostic factors [5–7]. We therefore investigated possible correlation between the 3D ultrasound characteristics of invasive ductal carcinoma with pathologic prognostic factors to determine whether 3D ultrasound could be useful in the non-invasive prognostic evaluation of breast cancer.

Materials and methods

Patients

This retrospective study was approved by the ethical standards of the institutional ethics committee, and informed consent was obtained from all patients.
From September 2011 to May 2013, 85 patients with 85 lesions, pathologically proven to be invasive ductal carcinoma, were included in this study. The exclusion criteria were pregnancy or lactation, administration of preoperative chemotherapies or adjuvant chemotherapies. Patients with a breast mass larger than 3.0 cm were also excluded because more than one 3D volume acquisition was necessary to include the whole lesion plus 3 mm surrounding the breast lesion. All patients were female and aged 26 to 90 years (mean age, 56.3 years).

Ultrasound examination

All ultrasound images were obtained with one type of system (GE Voluson E8 Expert, Zipf, Austria) by two radiologists with 7–12 years of experience in breast ultrasound. An 11 L-D linear transducer with a frequency of 5–12 MHz was used for 2D ultrasound, and an RSPr-16-D dedicated volume transducer with a frequency of 6–12 MHz was used for 3D ultrasound.

Ultrasound examination was performed with patients in the supine position with elevated arms. Once the breast lesion was

detected and the region of interest had been identified, the volume box was superimposed and set to include the entire display screen so as to cover the lesion and maximum amount of normal surrounding tissue. The sweep angle was adjusted to 15–29° according to the size of the breast lesion. Then the ultrasound probe was held still with enough jelly to contact the skin gently. The volume mode was switched on and the 3D ultrasound volume was generated by the automatic rotation of the mechanical transducer. When the first ultrasound examination was finished, the power Doppler mode was added for the second examination and the fixed prestimulated power Doppler settings used were 0.3 kHz pulse repetition frequency, “low 1” wall motion filter, “2.0 gain and high frequency. The first examination for 3D grayscale imaging took 10–20 s and the second, for 3D power Doppler imaging, took 25–45 s, depending on the size of the tumour. Then the total acquisition time for 3D ultrasound was about 1–2 min. The entire examination was saved in DICOM format and stored on the hard disk for further analysis.

Image analysis

The 3D ultrasound images were reviewed for this analysis by another two radiologists with 8–10 years of experience in breast ultrasound and characterized by consensus. In addition, the radiologists had not performed the data acquisition and were blinded to the patients’ clinical and mammographic findings.

The ultrasound image was opened by using the 4D View software. Firstly, the tomographic ultrasound imaging (TUI) was used for a slice by slice documentation in the coronal plane. Then, the volume contrast imaging (VCI) and the surface render mode were added for better observation of the lesion and the surrounding tissue. All the slices were carefully observed to identify the presence of the retraction pattern in the surrounding tissue and the margin of the lesion. The retraction pattern was defined as the hypercholeic straight lines that radiated perpendicularly from the surface of the solid nodule, producing a stellate pattern [8, 9] (Fig. 1). The presence of the retraction pattern was further divided into with or without a hypercholeic ring, which was displayed as an echogenic halo ring between the mass and the surrounding tissue in the coronal plane (Fig. 2a).

The 3D power Doppler imaging analyses were performed using a virtual organ computer-aided analysis (VOCAL)-imaging program (GE, Zipf, Austria), which could automatically calculate the histogram indices of vascularization index (VI), flow index (FI) and vascularization flow index (VFI). VI represents the vessels in the defined volume by measuring the number of colour voxels in the region of interest, i.e. the mean tumour vascularity; FI represents the average intensity of flow by measuring the mean colour value in the colour voxels, i.e. the mean blood flow volume; VFI represents both

Eur Radiol

regression modelling techniques to identify the most significant and independent 3D image findings. A P value less than 0.05 was considered statistically significant.

Results

Prognostic factors

In the current study group, the surgical specimens revealed 75 lesions with pure invasive ductal carcinoma and the remaining 10 lesions with invasive ductal carcinoma with DCIS components. The mean percentage of the DCIS components in the lesion was 8.10±4.93% (range, 2–20%).
The size of 85 lesions ranged from 5 to 30 mm, and the mean size was 19.92 mm (SD=7.56 mm). Of the 85 tumours, 47 (55.3%) were equal to or smaller than 2 cm and 38 (44.7%) were larger than 2 cm. According to the Elston–Ellis grading system, there were 58 (68.2%) grade II tumours and 27 (31.8%) grade III. Lymph node metastasis was present in 30 (35.3%) patients, 70 (82.4%) ER-positive, 54 (63.5%) PR-positive, 70 (82.4%) c-erbB-2-positive and 42 (49.4%) p53-positive tumours.

Correlation between MVD and prognostic factors

Significantly higher MVD was observed in the larger size group ($P<0.01$) and higher grade group ($P<0.05$). There were no significant associations between MVD and other pathological factors ($P>0.05$) (Table 1).

Correlation between morphological features and prognostic factors

Of the 85 breast lesions, 57 (67.1%) showed the retraction pattern in the coronal plane of 3D ultrasound. Of these 57 lesions, 17 (29.8%) showed the retraction pattern with a hypercholeic ring and 40 (70.2%) were without the hypercholeic ring.

The tumour size, histological grade, ER and PR status all showed significant associations with the presence of the retraction pattern ($P<0.01$) (Table 2). Tumours with the retraction pattern were significantly more likely to be small in size, low grade, ER-positive and PR-positive (Fig. 3). Moreover, the retraction pattern with a hypercholeic ring, which presented as intricately mixed fibrous tissues and infiltrating carcinoma cells on pathological specimens, only existed in low-grade and ER-positive tumours (Fig. 2). The odds ratios of tumour size, tumour grade, and ER and PR status for patients with the retraction pattern and a hypercholeic ring versus no retraction pattern were all higher than those with the retraction pattern without a hypercholeic ring versus no retraction pattern (Table 3). The presence of the hypercholeic ring strengthened

Table 1 Association between MVD and prognostic factors

Prognostic factor	N	Mean	SD	P value
Tumour size (cm)				
≤2	47	19.30	5.25	
>2	38	25.60	7.60	0.007
Tumour grade				
II	58	19.83	5.55	
III	27	25.83	8.02	0.023
Lymph node				
Negative	55	21.31	6.70	
Positive	30	22.08	7.34	0.946
ER				
Negative	27	23.27	8.36	
Positive	58	20.93	5.14	0.931
PR				
Negative	31	25.00	8.59	
Positive	54	19.82	5.09	0.092
c-erbB-2				
Negative	15	21.50	9.57	
Positive	70	21.55	6.65	0.788
p53				
Negative	43	23.13	7.04	
Positive	42	19.63	6.20	0.083

the ability of the retraction pattern to predict these good prognoses. However, the lymph node status and the expression of c-erbB-2 and p53 showed no statistically significant correlation with the retraction pattern ($P>0.05$).

As for MVD, however, no significant correlation was found between MVD and the presence of the retraction pattern on 3D ultrasound ($P=0.05$).

Correlation between vascularization perfusion and prognostic factors

For intra-tumour regions, the mean VI, FI and VFI of 85 lesions were 6.84 (range, 0.02–21.61), 37.72 (range, 21.81–53.32) and 2.64 (range, 0.04–9.11), respectively. For shells with a thickness of 3 mm surrounding the breast lesion, the VI, FI and VFI were 7.31 (range, 0.14–25.13), 38.72 (range, 23.27–56.90) and 2.88 (range, 0.04–11.08), respectively.

Compared with the small tumours, the tumour foci with a diameter greater than 2 cm were more likely to show a higher inVI, inFI, inVFI, out3mmVI and out3mmVFI. The tumours with a high grade or lymph node metastasis had a higher inVI, inVFI, out3mmVI and out3mmVFI than the tumours with low grade or lymph node-negative status. ER-negative tumours had a higher inFI than ER-positive tumours and the tumours with negative expression of PR had a higher inVI, inVFI and out3mmVFI than PR-positive tumours (Table 4).

Sentence splitting

- Splitting a text into sentences

11 Sentences (= "T-" or "Terminable" units *only* if independent clauses are punctuated as separate sentences, e.g. "I came and he went"-->"I came. And he went.")

Average 23.55 words (SD=12.10)

OBJECTIVES: To investigate the correlation of three-dimensional (3D) ultrasound features with prognostic factors in invasive ductal carcinoma.

METHODS: Surgical resection specimens of 85 invasive ductal carcinomas of 85 women who had undergone 3D ultrasound were included.

Morphology features and vascularization perfusion on 3D ultrasound were evaluated.

Pathologic prognostic factors, including tumour size, histological grade, lymph node status, oestrogen and progesterone receptor status (ER, PR), c erbB-2 and p53 expression, and microvessel density (MVD) were determined.

Correlations of 3D ultrasound features and prognostic factors were analysed.

RESULTS: The retraction pattern in the coronal plane had a significant value as an independent predictor of a small tumour size (P #8201;= 0.014), a lower histological grade (P #8201;= 0.009) and positive ER or PR expression status (P #8201;= 0.001, 0.044).

The retraction pattern with a hyperechoic ring only existed in low-grade and ER-positive tumours.

The presence of the hyperechoic ring strengthened the ability of the retraction pattern to predict a good prognosis of breast cancer.

The increased intra-tumour vascularization index (VI, the mean tumour vascularity) reflected a higher histological grade (P #8201;= 0.025) and had a positive correlation with MVD (r #8201;= 0.530, P #8201;= 0.001).

CONCLUSIONS: The retraction pattern and histogram indices of VI provided by 3D ultrasound may be useful in predicting prognostic information about breast cancer.

KEY POINTS: • Three-dimensional ultrasound can potentially provide prognostic evaluation of breast cancer. • The retraction pattern and hyperechoic ring in the coronal plane suggest good prognosis. • The increased intra-tumour vascularization index reflects a higher histological grade. • The intra-tumour vascularization index is positively correlated with microvessel density.

Named-entity recognition

- Identifying pre-defined entity types in a sentence

The screenshot displays the b2cas Annotate interface. On the left, a 'HIGHLIGHT' sidebar lists categories: Anatomy, Disorders, Chemicals, Genes and Proteins, Cellular Components, Molecular Functions, Biological Processes, and Ambiguous. The main text area contains a paragraph about Duchenne muscular dystrophy (DMD) with various entities highlighted in colored boxes. Below the text, there are 'Load text' and 'Export' buttons. At the bottom right, it states 'Annotated 46 concept occurrences in 0.173s.' On the right side, a 'Concept Tree' shows a hierarchical view of the identified entities, including categories like Anatomy (12), Disorders (4), Chemicals (2), Genes and Proteins (11), Cellular Components (3), Molecular Functions (1), and Biological Processes (9).

Text Snippet:

In **Duchenne muscular dystrophy (DMD)**, the **infiltration** of **skeletal muscle** by immune **cells** aggravates disease, yet the precise mechanisms behind these **inflammatory responses** remain poorly understood. Chemotactic cytokines, or chemokines, are considered essential recruiters of **inflammatory cells** to the **tissues**. We assayed chemokine and chemokine **receptor expression** in **DMD muscle** biopsies (n = 9, average age 7 years) using immunohistochemistry, immunofluorescence, and in situ **hybridization**. **CXCL1**, **CXCL2**, **CXCL3**, **CXCL8**, and **CXCL11**, absent from normal **muscle fibers**, were induced in **DMD** myofibers. **CXCL11**, **CXCL12**, and the **ligand**-receptor couple **CCL2**-**CCR2** were upregulated on the **blood vessel endothelium** of **DMD** patients. **CD68** (+) **macrophages** expressed high levels of **CXCL8**, **CCL2**, and **CCL5**. Our data suggest a possible beneficial role for **CXCR1/2/4 ligands** in managing **muscle fiber** damage control and **tissue** regeneration. Upregulation of **endothelial chemokine receptors** and **CXCL8**, **CCL2**, and **CCL5** expression by cytotoxic **macrophages** may regulate myofiber **necrosis**.

Word sense disambiguation

- Figuring out the exact meaning of a word or entity

Noun 1. tie - neckwear consisting of a long narrow piece of material worn (mostly by men) under a collar and tied in knot at the front; "he stood in front of the mirror tightening his necktie"; "he wore a vest and tie"

[necktie](#)

[bola](#), [bola tie](#), [bolo](#), [bolo tie](#) - a cord fastened around the neck with an ornamental clasp and worn as a necktie

[bow tie](#), [bow-tie](#), [bowtie](#) - a man's tie that ties in a bow

[four-in-hand](#) - a long necktie that is tied in a slipknot with one end hanging in front of the other

[neckwear](#) - articles of clothing worn about the neck

[old school tie](#) - necktie indicating the school the wearer attended

[string tie](#) - a very narrow necktie usually tied in a bow

[Windsor tie](#) - a wide necktie worn in a loose bow

2. tie - a social or business relationship; "a valuable financial affiliation"; "he was sorry he had to sever his ties with other members of the team"; "many close associations with England"

[affiliation](#), [tie-up](#), [association](#)

[relationship](#) - a state involving mutual dealings between people or parties or countries

3. tie - equality of score in a contest

[equivalence](#), [par](#), [equality](#), [equation](#) - a state of being essentially equal or equivalent; equally balanced; "on a par with the best"

[deuce](#) - a tie in tennis or table tennis that requires winning two successive points to win the game

4. tie - a horizontal beam used to prevent two other structural members from spreading apart or separating; "he nailed the rafters together with a tie beam"

[tie beam](#)

[beam](#) - long thick piece of wood or metal or concrete, etc., used in construction

Word sense disambiguation

Analysis with definitions(s)

Bill Gates has developed an interest/[readiness to give attention] in language technology and yesterday acquired a 10 % interest/[a share (in a company, business, etc.)] in Torbjörn Lager 's sense disambiguation technology . Lager will retain a 90 % interest/[a share (in a company, business, etc.)] in the new company , which will be based in Göteborg , Sweden . Last year 's drop in interest/[money paid for the use of money] rates will probably be good for the company . Finally , although all this may sound like an arcane maneuver of little interest/[quality of causing attention to be given] outside Wall Street , it would set off an economical earthquake .

These are the six senses of the noun *interest* according to the LDOCE:

Sense	Definition
1	readiness to give attention
2	quality of causing attention to be given
3	activity, subject, etc., which one gives time and attention to
4	advantage, advancement, or favour
5	a share (in a company, business, etc.)
6	money paid for the use of money

John reads a book. He borrowed it from his friend.

Berlin (/bɛərˈlɪn/, German: [bɛʁˈliːn] (ⓘ listen)) is the capital of Germany, and one of the 16 states of Germany. With a population of 3.5 million people,^[4] Berlin is Germany's largest city. It is the second most populous city proper and the seventh most populous urban area in the European Union.^[5] Located in northeastern Germany on the banks of River Spree, it is the center of the Berlin-Brandenburg Metropolitan Region, which has about 6 million residents from over 180 nations.^{[6][7][8][9]} Due to its location in the European Plain, Berlin is influenced by a temperate seasonal climate. Around one third of the city's area is composed of forests, parks, gardens, rivers and lakes.^[10]

Paraphrasing

- Different words/sentences express the same meaning
 - Season of the year
 - Fall
 - Autumn
 - Book delivery time
 - When will my book arrive?
 - When will I receive my book?

Ambiguity

- One word/sentence can have different meanings
 - Fall
 - The third season of the year
 - Moving down towards the ground or towards a lower position
 - The door is open.
 - Expressing a fact
 - A request to close the door

Phonetics and Phonology

Communication tip:

Phonological ambiguities or **Give peas a chance!**

One of my favourite ways to have fun with communication are phonological ambiguities.

Phonological ambiguities are two or more words which sound the same and have different meanings.

Language can contain ambiguities - and more than one way to compose a set of sounds into words.

So listen to yourself: It is always good to notice a spoken sentence often contains many words which are (sometimes not)

intended to be heard.

English examples:

- there - their
- here - hear
- plane - plain
- Hamburger (Citizens of Hamburg) - hamburger (burger, food)
- sea - see
- Friday - fry day
- weekend - weak end
- ice cream - I scream.
- new direction - nude erection
- new day - nude, eh?
- I don't know! - I don't - no!
- but - butt
- Wait - Weight
- psychotherapist - psycho the rapist
- You're unconscious now... - Your unconscious now...
- Your students... - You're students...
- Two - too - to

German examples:

- Du hast Gewehre. (You have got guns.) - Du hasst Gewehre. (You hate guns.)
- Lehrer (teacher) - leerer (emptier)

Syntax and ambiguity

- I saw the man with a telescope.
 - Who had the telescope?

(<http://www.realtytrac.com/landing/2009-year-end-foreclosure-report.html>)

Semantics

- The astronomer loves the **star**.
 - Star in the sky
 - Celebrity
