### "Discriptive Essay"

#### " If I were Presentent"

Sometimes really it comes in my mind that if I really become a Presentent of Pakistan so I also would do alot things which are in my mind.

If I were president I would strive to accomplish these three major things. First, I would strengthen our educational system, second, I would make certain that everyone has equal and fair treatment in our society, and lastly, I would secure our borders and I will work for the liberation of the Kashmiris and will free them from Indian forces. If I have to sacrifice my life for them, I will gladly do that.

Our education system is not one in which we should be very proud of. Yes, Pakistan does have excellent schools, colleges, and learning institutions, but our standards are not set as high as other countries. For example, our country does not fund our schools adequately. Teachers teach with not enough books, no supplies, or books that are often over 20 years old. How can we expect our children to be up to date with the worlds information if our teaching materials are not new? Often teachers in our public schools are forced to buy text books and supplies for our children with their own personal money. Why do they do this? Because they believe in a good education for all learners. Our country "prides" itself on the quality of education a person can receive here, yet teachers are one of the countries lowest paid professionals.

If I were President then I would do is to ask all the teachers of Pakistan to help students in their studies and extracurricular activities with their whole heart.

Ten best teachers, whose students perform extraordinarily well, would be selected from all the schools in Pakistan. These selected teachers, along with their families, would be sent for a 10-day fun trip by the government.

If I get the opportunity to be the leader of Pakistan, then I would eradicate corruption and corrupt leaders of the country. Every department would be free from corruption, and honesty and justice would prevail

If I were President, I would like to bring about an improvement in social services, particularly related to women's social and health issues. I would introduce a helpline for women who are in any sort of danger, and have separate parking areas for them too.

If I were president, I would also make sure that everyone in this country was treated equal and fair.

I would try to end pollution from Pakistan and there would be strict rules to stop people from throwing even a single wrapper or litter. If anyone did that then they would get punished.

I would do would be to change Pakistan into a clean country. There will be dustbins everywhere and anyone who spits on the road will be fined. I will make sure sweepers are paid very well and that dustbins are emptied regularly.

I will help the beggars, give jobs to the youth, remove corruption and punish the corrupt. I will do things because of which in every country there would be most respect of my country Pakistan.

My last and final act would be trying to make peace with as many countries as I could, but at the same time still having war with the countries I haven't made peace with. Then, with the countries I made peace with, I would trade with them goods with goods so both of us could easily get what we can't reach. Plus, if I don't make peace with other countries, I would make or try to grow goods here in the US so we don't have to import and waste time, gas, and money.

In conclusion, If I were president I would try to make the world a better place for everyone, and save our planet. I will implement rules to destroy feudalism. I will end discrimination and promote equal rights and justice so that Pakistan becomes a peaceful and prosperous.

**"Argumentative essay" :**

— **" Is technology limiting**  
— **Creativity?"**

Technology has the most important part in our lives. We use it in our works in our study and many more. Some people would agree that technology reduce the children creativity, others would disagree.

Nowadays people are not using their brain and depending upon technology which is made by some others brain. (eg- Doing simple calculations people use Calculators.)

There were times when people used to spend their time in creative activities, with their family and friends, but today whenever we are idle and feel bored, we just pick up our smartphone, laptop or tablet and start playing games or enter in the fake world of social media.

Computers and other such devices we given to us for making our life easier, but too much dependency on such devices has brought us to present alarming situation.

Computers have been trained to paint pictures and compose music, but they have not yet mastered creative cognition—thinking divergently, going back and forth between conventional and unconventional thinking, making errors, and deciding on the best, most useful response, given a particular situation. On this level, creativity can be seen as intelligence that is emergent from serendipitous error. But this isn't how we program computers—we want them to be error-free.

It is more common to find people on their phones looking at social apps, playing games, or texting rather than communicating to others face to face. Today's generation find it difficult to talk to people because it can get “awkward” and it is easier to be on a device rather than a phone. As technology keeps advancing, will it cause people to be less creative? Technology is created to make situations easier, but have we gone to a point where we rely on technology too much that it actually hurts society rather than help.

There has been decades of theory and research in child development that tells us how the brain works for a child and how much of an impact their primary years are. It is important for children to play and engage in the “real world” by being active. Kids learn to be creative through direct play and hands-on experience with materials, people, and in nature, “kids need first-hand engagement — they need to manipulate objects physically, engage all their senses, and move and interact with the 3-dimensional world.” With these first hand engagement, it maximizes their learning and brain development. However, with screens being a distractor, it takes away from their creativity and more kids playing less than the previous generation.

It is not mentioned often, but play has a huge role in imagination. "Play is a remarkably creative process that fosters emotional health, imagination, original thinking, problem solving, critical thinking, and self-regulation." Through playing, kids are able to create their own scenario, work through difficult times, build self-confidence and feel a sense of mastery. If they play with materials, they are learning to understand concepts and skills that are the principles for later academic learning. By learning how to play, they are also learning how to learn such as asking questions, creating and solving their own problems and taking initiative. Some examples of kids using materials to build creativity is using blocks, playdough, markers/colors, paint, sand and water. It is proven by neuroscientists that if children play this way, they are able to activate pathways and connections in their brain.

Although technology is beneficial and useful for kids, what children see and interact on the screen is not the same as the full experience for kids interacting in the real world with people and things. It may seem like these education apps for children will assist their education, but they do not grasp the underlying concept of learning.

As a conclusion, I feel technology is making us lazy as well as less intelligent. The amount we depend on technology today is unrivaled and this rudimentary conundrum has to be avoided. Even a simple calculation has to be done by a calculator nowadays, not our mind.
