Assignment

operative dentistry.

porcelain jacket crown preparation.  
(Depth orientation grooves)

A flat end tapered diamond is first aligned with the incisal portion of the facial surface and two vertical cuts are made to the full diameter of the diamond, fading out at the break where the curvature of the facial surface is the greatest. Three similar grooves are made maintaining the same instrument parallel to the gingival segment of the facial surface. Two incisal orientation grooves 2.0 mm deep are made.
