NAME :- RIMSUA KHAN  
 SUBJECT :- CCN

I.D :- 13672  
 SUBMITTED TO :- SIR WAQAS

### QUESTION 1 :-

An NRZ-I signal has a data rate of 100 Kbps. Using figure calculate value of normalized energy (P) for frequencies of 0Hz, 50KHz and 100 KHz.

### Given data :-

$$N = 100 \text{ Kbps}$$

$$F = 0 \text{ Hz}, 50 \text{ KHz}, 100 \text{ KHz}$$

$$P = ?$$

So,

first we find  $F/N$  :-

$$\begin{aligned} F/N &= 0/100 \\ &= \boxed{0} \end{aligned}$$

For 50KHz,

$$\begin{aligned} F/N &= 50/100 \\ &= \boxed{\frac{1}{2}} \end{aligned}$$

For 100KHz,

$$\begin{aligned} F/N &= 100/100 \\ &= \boxed{1} \end{aligned}$$

Finding energy P :-

By graph it has clear that  
 At point 0,

$$P = \boxed{1.0}$$

At  $\frac{1}{2}$  :-

$$P = 0.5$$

At 1 :-

$$P = 0.0$$

b, What is the Nyquist Sampling rate for each of the following?

(i) A low-pass signal with bandwidth of 200 KHz?

Sol: Low pass signal with bandwidth = 200 KHz

$$200 \text{ KHz} \Rightarrow 200 \times 10^3 \text{ Hz} \\ = 200,000 \text{ Hz}$$

Nyquist rate formula :-

$$\text{Nyquist rate} = 2 \times f_{\text{max}}$$

So,

in low-pass signal  $f_{\text{min}} = 0$

So,

$$\text{Nyquist rate} = 2 \times f_{\text{max}} \\ = 2 \times 200,000$$

$$= 4,00,000 \text{ Samples}$$

(ii) A band-pass signal with bandwidth of 200 KHz, lowest frequency is 100 Hz.

As we know that

$$\text{Nyquist rate} = 2 \times f_{\text{max}}$$

We have  $f_{\text{min}} = 100 \text{ Hz}$  and  $f_{\text{max}} = 200$

$$\text{So } f_{\text{max}} = 100 + 200 = 300 \text{ KHz}$$

$$f_s = 2 \times 300,000$$

$$= 600,000 \text{ Samples}$$

c, We have sampled a low pass - signal with bandwidth of 200kHz using  $1024$  levels of quantization?

ii) Calculate the bit rate :-

As we find that

$$\begin{aligned} \text{Nyquist rate} &= 2 \times f_{\text{max}} \\ &= 200,000 \times 2 \\ &= 400,000 \text{ samples} \end{aligned}$$

So,

$$\begin{aligned} \text{Bit rate} &\Rightarrow n_b = \log_2 1024 \\ &= 10 \text{ bits/sample} \end{aligned}$$

So,

Quantization 10 bits / sample.

So,

$$\begin{aligned} \text{Bit rate} &= 400,000 \times 10 \\ &= \boxed{4 \text{ Mbps}} \end{aligned}$$

iii) Calculate SNRdB of this signal.

We have  $n_b = 10$  bits

So,

$$\begin{aligned} \text{SNR}_{\text{dB}} &= 6.02 \times n_b + 1.76 \\ &= 6.02 \times (10) + 1.76 \\ &= 60.2 + 1.76 \\ &= \boxed{61.96} \end{aligned}$$

iii) Calculate the PCM :-

$$n_b = 10 \text{ bits} \quad B = 200 \text{ kHz}$$

$$\begin{aligned} B_{\text{PCM}} &= n_b \times B_{\text{analog}} \\ &= 10 \times 200 \times 10^3 \\ &= 10 \times 200,000 \\ &= \boxed{2 \text{ MHz}} \end{aligned}$$

4, What is the maximum data rate of a channel with a bandwidth of 200 KHz if we use four levels of digital signaling?

$$B = 200 \text{ KHz} \quad n_b = \log_2 4$$

So,

$$\begin{aligned} N_{\max} &= 2 \times B \times n_b \\ &= 2 \times 200,000 \times \log_2 4 \\ &= 800 \text{ Kbps} \end{aligned}$$

Q2 Draw the graph of NRZ-L, NRZ-I, Manchester and differential Manchester using following data streams?

a, 01010101

b, 00110011

**Solution:-**

First we have to find bandwidth.

**NRZ-L:-**

In NRZ the voltage level are both sides of the time axis.

Voltage level +ve = 0

Voltage level -ve = 1

**Graph:-**

For 01010101

For 00110011

NRZ-L has a average signal rate is  $N/2$  means average no of changes in the signal level.

The minimum bandwidth of average band rate is

$$B_{\min} = S = \frac{N}{2}$$

$$B_{\min} = \frac{N}{2}$$

### NRZ-I :

In this case inversion occurs when next bit is 1 other with no inversion.

For 010101

For 00110011

average signal rate of NRZ-I is  
 $= N/2$

$$B_{\min} = \frac{N}{2}$$

Manchester Scheme :-  
For 01010101

For 00110011

Q3 Question 3 :-

A TV channel has bandwidth of 6MHz. If we send digital signal using one channel. What are the data rates if we use one harmonic, 3 and 5?

Given data:-

TV channel bandwidth  $B = 6\text{MHz}$

Sol,

For 1 channel.

$$\text{Bandwidth (B)} = \frac{\text{data rate (bit rate)}}{2}$$

$$\begin{aligned} \text{Data rate} &= 2 \times B \\ &= 2 \times 6 \\ &= 12\text{Mbps} \end{aligned}$$

Similarly, For 3 :-

$$\begin{aligned} \text{Data rate} &= \frac{2 \times B}{3} \\ &= \frac{2 \times 6}{3} \\ &= \frac{12}{3} \\ &= 4\text{Mbps} \end{aligned}$$

Now for 5 :-

$$\begin{aligned} \text{Data rate} &= \frac{2 \times B}{5} \\ &= \frac{2 \times 6}{5} \\ &= \frac{12}{5} = 2.4\text{Mbps} \end{aligned}$$

- (ii) A signal travel from point A to B. At point A signal power is 100 watt. At point B power is 90 W. What is the attenuation in decibels?

**Solution :-**

$$\text{At point A :- } P = 100 \text{ W}$$

$$\text{At point B :- } P = 90 \text{ W}$$

$$\text{Attenuation} = ?$$

So,

$$\text{attenuation in (dB)} = 10 \log_{10} \frac{B}{A}$$

$$= 10 \log_{10} \left( \frac{90}{100} \right)$$

$$= 10 \log_{10} (0.9)$$

$$= 10 (-0.046)$$

So,

$$\log_{10} (0.9) = -0.046$$

$$\text{Attenuation (dB)} = -0.46 \text{ dB}$$

- (iii) The attenuation of a signal is -10dB. What is the final signal power if it was originally 5.

Attenuation is the reduction of strength in the power of a signal due to external factors.

$$P = 5 \text{ W}$$

$$\text{attenuation} = -10 \text{ dB}$$

**Formula:-**

$$-10 = 10 \log_{10} (P_d/5)$$

$$P_d = 10^{-1} \times 5$$

$$P_d = 0.5 \text{ W}$$

(iv) A signal has passed through 3 cascade amplifiers each with a 4dB gain. What is the total gain? How much the signal is amplified?

First we find total gain.

$$\text{Amplifiers} = 3$$

$$\text{Each gain} = 4\text{dB}$$

$$\text{So, total gain} = 3 \times 4\text{dB}$$

$$P_{dB} = 12\text{dB}$$

Now,

Signal amplified

$$P_{dB} = 10 \log_{10} P$$

$$P = 10 \frac{P_{dB}}{10}$$

$$P = 10 \frac{12}{10}$$

$$P = 10 \frac{12}{10}$$

$$P = 15.85$$

2) If the bandwidth of channel is 5Kbps, how long does it take to send a frame of 100,000 bits out of this device?

Solution:-

$$\text{Bandwidth} = 5\text{Kbps}$$

Convert it in to bps.

$$(1\text{Kbps} = 1000 \text{ bps})$$

$$\text{So } (5\text{Kbps} = 5000 \text{ bps})$$

$$B = 5000 \text{ bps}$$

$$\text{Frame} = 100,000 \text{ bits}$$

$$\text{Time } T = ?$$

$$T = \frac{100,000}{5000}$$

$$T = 20 \text{ Sec}$$

(vi) The light of sun takes approximately 8 minutes to reach the earth. What is the distance between the sun and the earth?

Solution :-

Time to reach earth = 8 minutes  
 Convert minutes in to seconds.  
 $8 \text{ min} = 8 \times 60 \text{ sec} \quad (1 \text{ hour} = 60 \text{ sec})$   
 $= 480 \text{ sec}$

Now convert m/s to km/s.  
 $= \frac{18600 \text{ miles}}{\text{Sec}} \times \frac{1 \text{ km}}{0.62 \text{ miles}}$   
 $= 300,000 \text{ km/s}$

Now,

Multiply sec with km/s  
 $= 480 \times 300,000$

Time Distance  $\Rightarrow$   $= 144,000,000 \text{ km/s}$

(b) A signal has 8 data levels with a pulse duration of 2ms. Calculate the pulse rate and bit rate?

Solution :-

data levels = 8

$T = 2 \text{ ms}$

Pulse rate = ?

Bit rate = ?

For Pulse :-

Pulse rate =  $\frac{1}{2 \text{ ms}}$  =  $500 \text{ pulse/sec}$

$$\begin{aligned} \text{Bit rate} &= \text{Pulse rate} \times \log_2 L \\ &= 500 \times \log_2 8 \\ &= 1500 \end{aligned}$$

**THE END**
