=> Overdenture :-

Overdenture is any removable dental prosthesis that covers and rests on one or more remaining natural teeth, the roots of natural teeth and/or dental implants.

it is one of the most practical measures used in preventive dentistry.

overdentures can be either tooth supported (conventional/immediate) or implant supported

it is formed found to the help in the preservation of alveolar bone and delay

the process of complete edentulism

An overdenture is a denture

(2)

the base of which covers one or more teeth.

prepared roots or implants

An overdenture is usually used for elderly patients that have lost some teeth but not all, rendering them suitable for a set of full dentures.

The overdenture is not rigid in the mouth.

It is removable.

⇒ Advantages of overdentures

As compared to traditional dentures, overdentures offer a variety of benefits of dental patients leading to a happier and healthier life.

- No more adhesive
- Prevent bone loss

(3)

- Simple maintenance
- Improve your quality of life
- Create levels of satisfaction
- Detects motion and position inside the mouth.
- leads to better digestion.

⇒ Types of overdenture treatment

(i) There are three types of overdenture.

⇒ Implant-retained, gum supported

(ii) The overdenture rests directly on the gums and is retained by the implants placed

⇒ Bar-retained implant-supported

(3) The overdenture engage retentive attachments or a metal bar that connects which are positioned

⇒ Fixed, implant-supported.

The overdenture and the bar act int
