ID:- 7952

Sec:- B

Semester:- 4<sup>th</sup>

Deptt:- BE (C)

Subject:- Fluid Mechanics

Submitted to:- Sir Abdul Waheed

①

Q1.) Define Viscosity? Derive  
i.) newton equation of  
Viscosity.

Viscosity:-

Viscosity is a measure of a fluid's resistance to flow. It describes the internal friction of a moving fluid. A fluid with large viscosity resists motion because its molecular makeup gives it a lot of internal friction.

(2)

A fluid with low viscosity flows easily because its molecular makeup results in very little friction when it is in motion.

**Example:-**

Syrup has a higher viscosity than water.

**Newton's Equation of Viscosity:-**

(3)

$$F \propto \frac{A u}{y}$$

co-efficient of  
 $\mu = \text{viscosity.}$

$$F = \frac{\mu A u}{y}$$

$F/A = \text{Shear stress}$

$$\frac{F}{A} = \frac{\mu u}{y}$$

$\tau = \text{Shear stress}$

$$\tau = \frac{\mu u}{y}$$

For Dry,  $\frac{du}{dy} = \text{Rate of Shear Deformation}$

$$\tau = \frac{\mu du}{dy}$$

This is called Newton's Equation of Viscosity.

(4)

b.) Define Density, Specific weight and Specific Volume. Show relation between Density and Specific Weight?

Density:-

The Density is the mass per unit volume. The symbol most often used for density is  $\rho$ .

Mathematically, density is defined as mass divided by volume, where  $\rho$  is the density,  $m$  is the mass and  $V$  is the Volume

$$\rho = \frac{m}{V}$$

(5)

## Specific Weight:-

The specific weight, known as the unit weight, is the weight per unit volume of material (fluid).

$$\gamma = \frac{W}{V}$$

It's unit is  $N/m^3$

## Relationship between Density And Specific Weight:-

As we know that,

$$\gamma = \frac{W}{V}$$

(6)

Where

$$W = mg$$

Now,

$$r = \frac{mg}{V}$$

Then,

$$P = \frac{m}{V}$$

where  $P$  is density

So,

$$r = P g \quad \text{or} \quad P = \frac{r}{g}$$

$r =$  specific weight.

$P =$  Density.

## Specific Volume:-

Specific Volume is defined as the number of cubic meters occupied by one kilogram of matter. It is the ratio of a material's volume to its mass, which is reciprocal of its density. Simply inversely proportional to density.

### Formula:-

$$v = 1/\rho$$

$\rho$  = density.

### Unit:-

$$\text{m}^3/\text{kg}.$$

(8)

c) If specific volume of gas is  $0.72 \text{ m}^3/\text{kg}$ . What is Specific Weight in  $\text{N}/\text{m}^3$ ?

Solution:-

Given that,  
Specific Volume,  $V = 0.72 \text{ m}^3/\text{kg}$

We have to find,  
Specific Weight,  $\gamma = ?$

As,

$$V = 1/\rho$$

$$\rho = 1/V$$

$$\rho = 1/0.72$$

$$\rho = 1.38 \text{ Kg}/\text{m}^3$$

(9)

Now,

$$r = \rho g$$

$$r = 1.38 \times 9.81$$

$$r = 13.54 \text{ N/m}^3.$$

So,

The specific weight  
is =  $13.54 \text{ N/m}^3$ .

(10)

Q2.) Define Pressure? What is  
a.) an absolute and gauge  
Pressure?

Pressure:-

The amount of force exerted (thrust) on a surface per unit area is defined as "Pressure". It can also be defined as the ratio of the force to the area (over which the force is acting).

Formula:-

$$\text{Pressure (P)} = \frac{\text{Thrust}}{\text{Area}}$$

(11)

SI Unit:-

Pascal (Pa)

$$1 \text{ Pa} = 1/\text{Nm}^2.$$

Dimension:-

$$\text{ML}^{-1} \text{T}^{-2}$$

Types:-

- 1) Atmospheric Pressure
- 2) Absolute Pressure
- 3) Differential Pressure
- 4) Gauge Pressure.

(12)

## Absolute Pressure:-

Absolute Pressure is a pressure that is related or relative to the zero pressure in the empty, air free space of the universe. This reference pressure is the ideal or absolute vacuum. It is noted with subscript "abs" -  $P_{abs}$ .

## Gauge Pressure:-

The gauge pressure is defined as the difference between an absolute pressure ( $P_{abs}$ ) and the prevailing atmospheric

(13)

( $P_{amb}$ ). It is denoted with Subscript "e".  $P_e$  and is Calculated:-

$$P_e = P_{abs} - P_{amb}.$$

b) A water tank having dimensions of  $1500\text{mm} \times 1500\text{mm}$ . Depth of the water tank is equal to your ID number in mm.

What is the net pressure force on wall of water tank? Find the location of force application?

IF the water level drops to the half of the depth, what will be the force and point

14

of Application of force?

Sol:-

Given data:-

length,  $l = 1500 \text{ mm} = 1.5 \text{ m}$

Breadth,  $b = 1500 \text{ mm} = 1.5 \text{ m}$

Depth,  $h = 7952 \text{ mm} = 7.952 \text{ m}$

Unit weight of water  
Required data:-  $= 9.81 \text{ kN/m}^3$

a.) Net pressure = ?

b.) Location of force = ?

c.) If water level drops half of depth, find  $P$  and location of force.

a.) Net pressure:-

(15)

$$P = rh$$

$$P = 9.81 \times 7.952$$

$$P = 78.00912 \text{ KN/m}^2$$

b.)

$$\bar{y} = h/3$$

$$\bar{y} = \frac{7.952}{3}$$

$$\bar{y} = 2.650 \text{ m}$$

c.)

Pressure at half depth,

$$P' = r \frac{h}{2}$$

$$P' = 9.81 \times \frac{7.952}{2}$$

$$P' = 39.00456 \text{ KN/m}^2$$

(16)

Centroid,

$$\bar{y} = \frac{1}{3} \times \frac{b}{2}$$

$$\bar{y} = \frac{1}{3} \times \frac{7.952}{2}$$

$$\bar{y} = \frac{1}{3} \times 3.976$$

$$\bar{y} = 1.3253 \text{ m}$$
