Name: imran khan id: 14281

Subject: Object Oriented Programming

BS (CS,SE)

Instructor: M.Ayub Khan

Each question carry equal marks. Please answer briefly.

Q1. How many variables are being supported by java justify your answer with the help java coded example for each variable?

Three types of variables are being supported by java,

- 1. Local variables
- 2. Instant varaibale
- 3. Class/static variable

Local Variables

Decal variables are declared in methods, constructors, or blocks.

I Local variables are created when the method, constructor or block is entered and the

variable will be destroyed once it exits the method, constructor, or block.

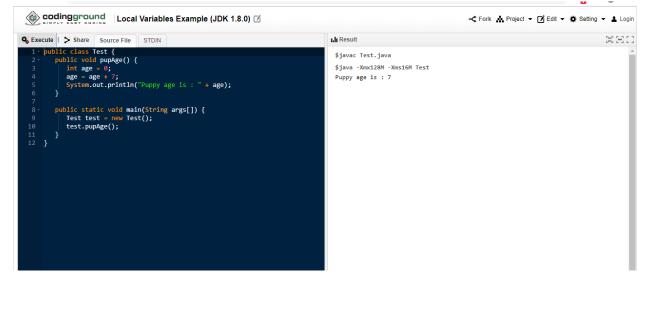

Access modifiers cannot be used for local variables.

I Local variables are visible only within the declared method, constructor, or block.

I Local variables are implemented at stack level internally.

There is no default value for local variables, so local variables should be declared and an

initial value should be assigned before the first use.

Instance Variables

Instance variables are declared in a class, but outside a method, constructor or any block.

When a space is allocated for an object in the heap, a slot for each instance variable value

is created.

Instance variables are created when an object is created with the use of the keyword 'new'

and destroyed when the object is destroyed.

Instance variables hold values that must be referenced by more than one method,

constructor or block, or essential parts of an object's state that must be present throughout

the class.

Instance variables can be declared in class level before or after use.

Access modifiers can be given for instance variables.

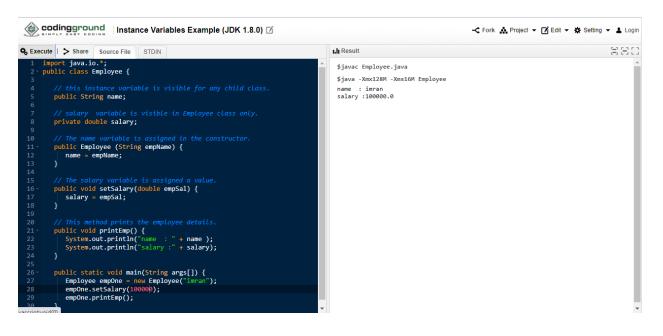

I The instance variables are visible for all methods, constructors and block in the class.

Normally, it is recommended to make these variables private (access level). However,

visibility for subclasses can be given for these variables with the use of access modifiers.

Instance variables have default values. For numbers, the default value is 0, for Booleans

it is false, and for object references it is null. Values can be assigned during the declaration or within the

Class/Static Variables

I Class variables also known as static variables are declared with the static keyword in a

class, but outside a method, constructor or a block.

There would only be one copy of each class variable per class, regardless of how many

objects are created from it.

I Static variables are rarely used other than being declared as constants.

Constants are

variables that are declared as public/private, final, and static. Constant variables never

change from their initial value.

Istatic variables are stored in the static memory. It is rare to use static variables other than

declared final and used as either public or private constants.

I Static variables are created when the program starts and destroyed when the program

stops.

I Visibility is similar to instance variables. However, most static variables are declared

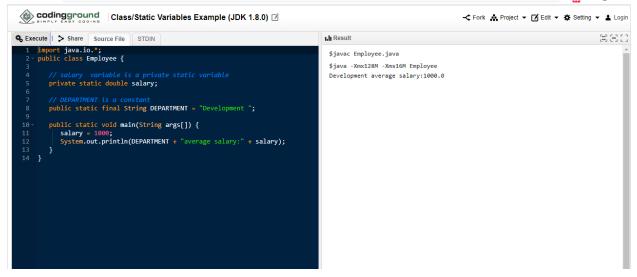

public since they must be available for users of the class.

Default values are same as instance variables. For numbers, the default value is0; fornBooleans, it is false; and for object references, it is null. Values can be

assigned during the declaration or within the constructor. Additionally, values can be assigned in special static initializer blocks.

Istatic variables can be accessed by calling with the class name ClassName.VariableName.

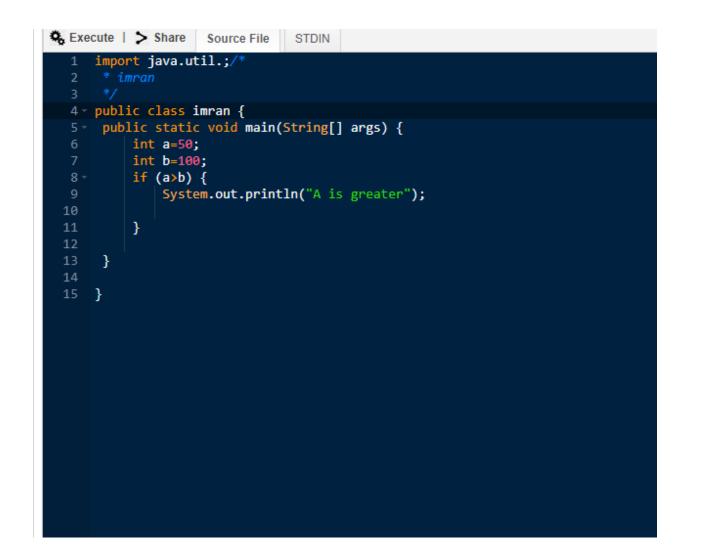

When declaring class variables as public static final, then variable names (constants) are all in upper case. If the static variables are not public and final, the naming syntax is the same as instance and local variables.

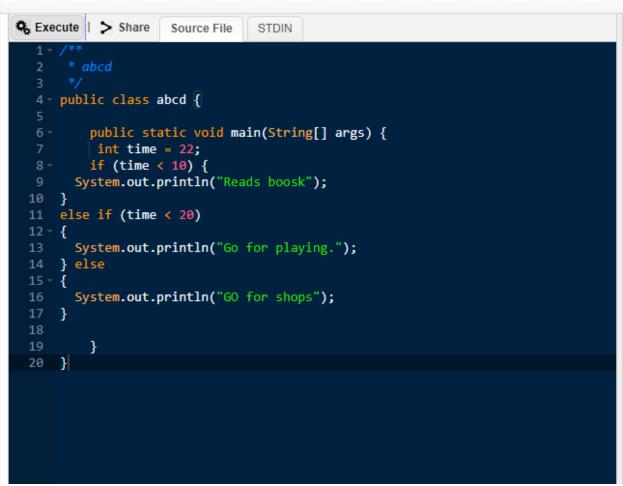

Q2. Why "If" is used in java justify your answer with the help java coded example and explain in detail?

ANSWER:

The Java if statement is the most simple decision-making statement. It is used to decide whether a certain statement or block of statements will be executed or not i.e if a certain condition is true then a block of statement is executed otherwise not. Control falls into the if block. CODE:

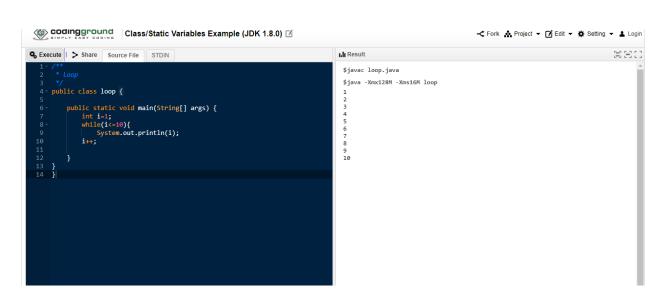

OUTPUT:

Q3. Why "if else if" is used in java justify your answer with the help java coded example and explain in detail?

ANSWER:

An if statement can be followed by an optional else statement, which executes when the boolean expression is false. if-else-if statement is used when we need to check multiple conditions. In this statement we have only one "if" and one "else", however we can have multiple "else if". It is also known as if else if ladder.

Q4. What are loops, why they are used in java and how many types of loops are being supported by java explain in detail?

A loop statement allows us to execute a statement or group of statements multiple times and

following is the general form of a loop statement in most of the programming languages Java programming language provides the following types of loop to handle looping requirements. Click the following links to check their detail. There are three types of loop;

WHILE LOOP:

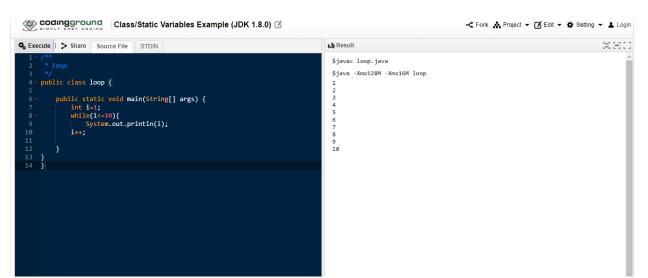

Repeats a statement or group of statements while a given condition is true. It tests the condition before executing the loop body.

FOR LOOP:

Execute a sequence of statements multiple times and abbreviates the code that manages the loop variable.

DO WHILE LOOP:

Like a while statement, except that it tests the condition at the end of the loop body.

Q5. Write 3's table in decremented form in java which takes input from user write java coded program and explain in detail?

```
1
    import java.util.Scanner;
2
3
    public class Exercise7 {
4
5
     public static void main(String[] args) {
6
    Scanner in = new Scanner(System.in);
 7
8
      System.out.print("Input a number: ");
9
      int num1 = in.nextInt();
10
      for (int i=0; i< 10; i++){
11
12
       System.out.println(num1 + " x " + (i+1) + " =
13
          (num1 * (i+1)));
14
      - }
15
     }
16
    }
```

```
Input a number: 8
8 x 1 = 8
8 x 2 = 16
8 x 3 = 24
8 x 4 = 32
8 x 5 = 40
8 x 6 = 48
8 x 7 = 56
8 x 8 = 64
8 x 9 = 72
8 x 10 = 80
```

```
import java.util.Scanner;
 1
 2
 3
    public class Main {
4
     public static void main(String[] args) {
 5
    Scanner in = new Scanner(System.in);
 6
      System.out.println("Input the Number: ");
 7
8
    int n = in .nextInt();
9
     for (int i = 1; i <= 10; i++) {
    System.out.println(n + "*" + i + " = " + (n * i));
10
11
      }
12
    }
13
    }
```

Input the Number:
6
6*1 = 6
6*2 = 12
6*3 = 18
6*4 = 24
6*5 = 30
6*6 = 36
6*7 = 42
6*8 = 48
6*9 = 54
6*10 = 60

```
public class MultiplicationTable {
    public static void main(String[] args) {
        int num = 5;
        for(int i = 1; i <= 10; ++i)
        {
            System.out.printf("%d * %d = %d \n", num, i, num * i);
        }
    }
}</pre>
```

Output

5 * 1 = 5 5 * 2 = 10 5 * 3 = 15 5 * 4 = 20 5 * 5 = 25 5 * 6 = 30 5 * 7 = 35 5 * 8 = 40 5 * 9 = 455 * 10 = 50
