Pg # 1

Q1: In a block of addresses, we know the IP address of one host is  $101.10.11.X/ID_{4+5}$ . What is the first address (network address) and the last address (limited broadcast address) in the block?

Sol:

$$ID = 14840$$

$$X = 17$$

$$4^{\text{th}} = 4$$

$$5^{\text{th}} = 0$$

$$= 4^{\text{th}} + 5^{\text{th}} \Rightarrow 4 + 0 = 4$$

In a block of addresses, we know the IP address is  $101.10.11.17/4$ .

Convert into binary numbers.

110010110101011000100

First address

$$17 - 4 = 13$$

Convert last 13 bits to 0

110010110100000000

Now convert this into decimal

101.10.0.0/0

last address.

Convert right most bit into 1

1100101 1010 1011 10001 111

101.10.11.1717

Q2: Take your Roll No as decimal notation, now convert it to Binary notation. Draw the graph of the NRZ-L scheme using the binary notation of your roll no as data stream, assuming that the last signal level has been positive.

Sol: Roll No = 14840

How to convert into binary numbers.

14840

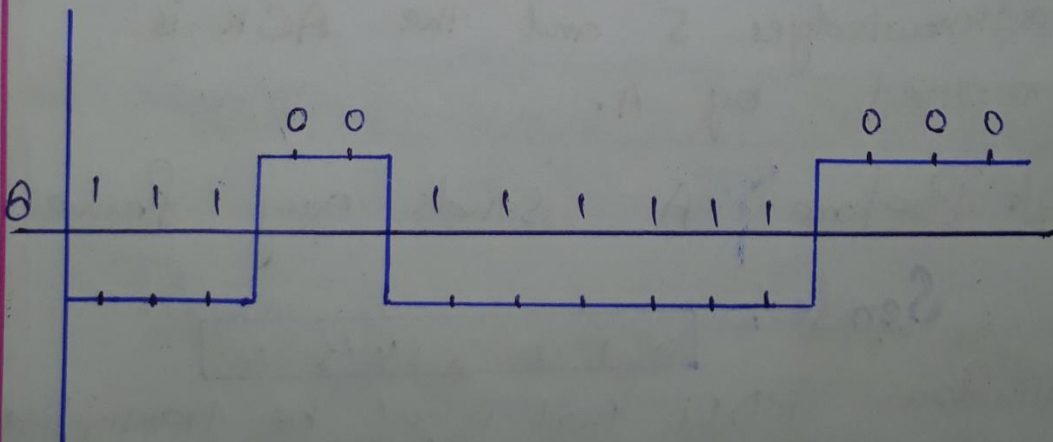

Pg # 33

14840 = 1110011111000

2	14840
2	7420 - 0
2	3710 - 0
2	1855 - 0
2	927 - 1
2	436 - 1
2	231 - 1
2	115 - 1
2	57 - 1
2	28 - 1
2	14 - 0
2	7 - 0

	1 - 1

NRZ-L Scheme

Graph:

Q3: Two neighbouring nodes (A and B) use a sliding-window protocol with a 3-bit sequence number. As the ARQ mechanism, go-back-N is used with a window size of 1D last.

Assuming A is transmitting and B is receiving, show the window positions from

~~B for 0, 1 and 2~~ for the following succession of events:

- \* Before A sends any frames.
- \* After A sends frames 0, 1, 2, 3, 4 and receives acknowledgment from B for 0, 1 and 2.
- \* After A sends frames 5, 6 and B acknowledges 5 and the ACK is received by A.

Sol: Before A sends any frames: →

A,

Sender:-

0	1	2	3	4	5	6
---	---	---	---	---	---	---

Window PDU that may be transmitted  
4 bits window.

Receiver:-

0	1	2	3	4	5	6
---	---	---	---	---	---	---

B, Sender:- A has shrunk its window as it has transmitted 3 PDUs but has received ask for 2 PDUs hence it is :-

0	1	/	2	3	4	5	6
---	---	---	---	---	---	---	---

Acknowledgment receive for two bits.

Receiver:-

0	1	/	2	3	4	5	6
---	---	---	---	---	---	---	---

Receiver has received all data hence the window remain in 4 bits size.

C, Sender:-

0	1	2	3	4	/	5	6	7	0	1
---	---	---	---	---	---	---	---	---	---	---

Receiver:-

0	1	2	3	4	5	6	7	0
---	---	---	---	---	---	---	---	---

Acknowledgment received for 3 bits.

14840

Page # 6

Now window size.

$$ID = 14840$$

by formula.

$ID_{last} > 5$  then  $ID_{last}/2$

But here the last digit of

ID is 0 ~~one~~ <sup>so</sup> we write as

it is.

$$ID_{last} = 0$$

So window size is 0.

14840

Pg # 7

Q4: An ISP is granted a block of addresses starting with  $160.(x).(ID_{3+4}).0/16$ .

The ISP needs to distribute these addresses to three groups of customers as follows:

Design the sub-blocks and find out how many addresses are still available after these allocations.

★ A. The first group has 16 customers; each needs 64 addresses.

Sol: Address =  $160.(x).(ID_{3+4}).0/16$

$$ID(x) = 14840$$

$$\text{Sum of ID} = 17$$

$$ID_{3+4} = 12$$

$$160.17.12.0/16$$

(A) The first group has 16 customers  
each customer need 64 address.

First group:-

For this group each customer  
needs 64 address. This means  
that 6 ( $\log_2 64$ ) bit are  
needed to define each host.

The prefix is the  
 $32 - 6 = 26$

First customer = 160.17.12.0/26

2nd customer = 160.17.12.1/26

⋮

64 customers = 160.17.12.63/26

= 160.17.12.255/26

Total =  $16 \times 64 = 1024$

B. The second group has 64 customers  
each need 32 address.

Sol:-

14840

Pg # 9.

1st Customer:-  $160 \cdot 17 \cdot 12 \cdot 0/28$   
 $= 160 \cdot 17 \cdot 12 \cdot 255/28$

2nd Customer:-  $160 \cdot 17 \cdot 12 \cdot 1/28$

$\vdots$   $\vdots$   $= 160 \cdot 17 \cdot 12 \cdot 254/28$

16 Customer:-  $160 \cdot 17 \cdot 12 \cdot 15/28$

$= 160 \cdot 17 \cdot 12 \cdot 240/28$

Total =  $16 \times 64 = \boxed{1024}$
