

IQRA NATIONAL UNIVERSITY

MID TERM ASSIGNMENT PAPER

SUBJECT: ENGINEERING MECHANICS

SEMESTER: SPRING FALL 2020

MODULE: 2ND SEMESTER

ID: 16083

INSTRUCTOR: MAJID NAEEM

NOTE: Attempt all questions.

Q1: Part (a): Two high strength flexibleof the system?

ANS:

$\sum F_x = T_2x - T_1x$
 $0 = T_2x - T_1x$
 $T_2x = T_1x$
 $T_1 \cos \theta = T_2 \cos \phi$
 $T_1 \cos 56^\circ = T_2 \cos 30^\circ$
 $T_1 (0.56) = T_2 (0.866)$
 $T_1 = 1.546 T_2 \quad \text{--- (1)}$

$\sum F_y = T_1y + T_2y - W$
 $W = T_1y + T_2y$
 $mg = T_1 \sin \theta + T_2 \sin \phi$ ← (θ is 30° and φ is 56°)
 $(181.4 \times 9.8) = T_1 (0.83) + T_2 (0.5)$
 $1777.72 = 1.3 T_2 + 0.5 T_2 \quad \therefore T_1 = 1.546 T_2$
 $1777.72 = 1.8 T_2$
 $1.8 T_2 = 1777.72$
 $T_2 = 987.6$ ← (2) put in (1)

$T_1 = 1.546 (987.6)$
 $T_1 = 1526.8$ ← Ans

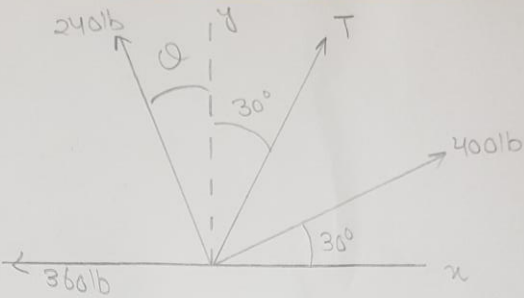

percentage of cable AB is 85.88%

Part (b): If the water weight and volume results of part (a).

ANS: If the water tank weight and volume of water are increased 15% and 35% respectively then both the tensions in the cable AB and AC will also increase according to the percentage of the weight.

Q2: Four forces are exerted on the eye bolt as shown in figure. If the net effect on the bolt is a direct pull of 600 pounds in the y direction. Determine the values of T and Q.

ANS:

for x-component
 $\sum F_x = 0$
 $0 = -360 - 240 \sin Q + T \cos 30^\circ + 400 \cos 30^\circ$
 $360 \neq (Q \text{ is } \underline{30^\circ})$ because of corresponding angles.

$360 = -240 \sin 30^\circ + 0.87T + 348$
 $360 = -120 + 0.87T + 348$
 $0.87T = \frac{132}{0.87}$
 $T = 151.7 - \textcircled{1}$

Now y-component
 $\sum F_y = 0$
 $600 = 240 \cos 30^\circ + T \sin 30^\circ + 400 \sin 30^\circ$
 $600 = 206.4 + 0.5T + 200$
 $0.5T = 400 - 206.4$
 $0.5T = \frac{193.6}{0.5}$
 $T = 387.2 - \textcircled{2}$
 solve $\textcircled{1}$ & $\textcircled{2}$ by subtracting

$T = 235.5$ | $Q = 30^\circ$

Q3: Calculate the reactions at supports.

ANS:

$$P_2 \text{ Resultant for UDL} = \frac{300 \times 7.5}{2} = 1125 \text{ lb}$$

$$P_2 \text{ Resultant for UDL} = 300 \times 3.65 = 1095 \text{ lb}$$

$$R_{1x} = 0 \quad \sum F_x = 0$$

$$R_{1y} + R_{2y} - 1500 - 18000 - 1095 = 0 \quad \text{--- (1)} \quad \sum F_y = 0$$

$$(R_{2y}) \times 12 - (1500 \times 2.5) - (18000 \times 7.5) - (1095 \times 9.825) = 0$$

$$12R_{2y} = 158326.85$$

$$R_{2y} = 13193.9 \text{ lb put in (1)}$$

$$R_{1y} + 13194 - 1500 - 18000 - 1095 = 0$$

$$R_{1y} = 8503.311 \text{ lb}$$
