Microbiology

Q1 What treatment should be given to a woman who has osteoporosis?

The treatments for osteoporosis includes complex exercise program that gives support and strength to muscles and bones to reduce the chances of injury and also help to stay independent for daily life activities teaching a well and proper movement including bending and lifting.

Q2 Difference between osteoporosis, osteomalacia and osteomyelitis.

The decrease of the bones mass is called osteoporosis, osteomalacia is the spongy condition of bones. Osteoporosis is caused due to vitamin D deficiency while on the other hand osteomalacia is caused due to the deficiency of calcium and phosphorous. Infection in bones is the condition of osteomyelitis in which the infection travels the bone through bloodstream.
