(1)

Question 1 (a)

Answer:- The summation is called the convolution sum of the sequence  $x[n]$  and  $h[n]$  and represented compactly as

$$y[n] = x[n] * h[n]$$

As we know

$$x[n] = x[n] + 2x[n-1] + 3x[n-2]$$

and

$$y[n] = 3x[n] + 2x[n-1] + x[n-2]$$

$$x[n] = x[0] \delta[n] + x[1] \delta[n-1] + x[2] \delta[n-2]$$

$$y[n] = x[0] f[n] + x[1] f[n-1] + x[2] f[n-2]$$

$$x[n] = \sum_{k=0}^2 x[k] f[n-k]$$

$$\text{for } y[n] = \sum_{k=0}^2 x[k] f[n-k]$$

(b) Given  $y[n] = x[n] + x[n-2]$

The graph is

Date: \_\_\_\_\_

(2)

Question 2 (a)

Answer:-

$$y(t) = n(t-3), \quad z(t) = n(t+5)$$

The above figure shows translation which is from right to left.

$$\text{At } t=3, \quad u(t)=1$$

$$\text{At } t+5=3, \quad u(t)=1$$

$$t = -5 + 3$$

$$t = -2$$

Compression:-  $n(3t)$

$$\text{At } t=3, \quad u(t)=1$$

$$\text{At } 3t=3, \quad u(3t)=1$$

$$3t=3$$

$$t = 3/3$$

$$t = 1$$

So  $y(t) = n(t-3), \quad z(t) = n(3t)$

Date: \_\_\_\_\_

(3)

(ii)  $n(t/4)$  &  $n(t-2)$

Expansion  $n(t/4)$  :-

$$\text{At } t=3, n(t)=1$$

$$\text{At } t/4=3, n(t/4)=1$$

$$\frac{t}{4}=3$$

$$t=12$$

Time delay :-

$$n(t-2)$$

$$\text{At } t=3, n(t)=1$$

$$\text{At } t-2=3, n(t)=1$$

$$t=2+3$$

$$t=5$$

(4)

So

Question No 3 :-

Fill in the blanks.

If a time shift in the input signal result in an identical time shift in the output signal, the system is said to be EVEN.

Question 2 (b)

(i) This system is non-invertible because we cannot determine the sign of the input from knowledge of output.

(ii) This system is non-causal because its output involves future value of the input so its non-causal.
