Question No 1.

Answer :-

2

Question No 2:-

Answer:-

While drawing up the system required specification, an engineer might keep track of the functional and non functional requirements by ensuring the following steps.

- 1) The design meets the requirements such as compatibility and portability.
- 2) System must ensure the safety and security.
- 3) Implementing the system in a good manner.
- 4) The cost that required to make the design can not affect the making of design and implementation of that system.

(3)

Here the non functional requirement defines what the expectation is out for the user.

The first step is to make document of system requirement.

It is the responsibility to make documents of each function and non-function requirement of engineer.

Non functional requirements needs the natural language and functional requirement & need structured language so the lang. document should be in these language.

The engineer need to prepare the way to link the functional and non functional to implement it.

The function requirements enforce the non functional requirement that shall be recorded.

(4)

Question 3

Answer:-

It is difficult to introduce agile method into large companies for numbers of reason.

1) Project managers who don't have any idea or experience of agile method, may be accept the risk of new approach, as they do not know how they effect the project.

2) Agile method seem to work best when team member have high skill level. However in the large organization there is wide range of skills and abilities and people with low abilities or skills may not be ~~able~~ effective in agile process.

(5)

3) There may be cultural resistance to agile methods specially in those organization that have a long history of using conventional system change management and testing procedures are example of company ~~practice~~ procedure that may not be compatible with agile method. All the change have to be approved in advance. In XP ~~ex~~ many developer can improve any code without getting external approval.
