# Introduction to Database Systems Lecture 9 

Engr. Madeha Mushtaq<br>Department of Computer Science<br>Iqra National University

## Relational Algebra

- Relational algebra operations work on one or more relations to define another relation leaving the original intact.
- Both operands and results are relations, so output from one operation can become input to another operation.
- Allows expressions to be nested, just as in arithmetic. This property is called closure.

## Relational Algebra

- There are 5 basic operations in relational algebra:
- Selection,
- Projection,
- Cartesian product,
- Union and
- Set Difference.

## Five Basic Operators

- These 5 operations perform most of the data retrieval operations needed.
- Also we have Join, Intersection, and Division operations, which can be expressed in terms of 5 basic operations.

## Five Basic Operators

- Unary Operators
- Select
- Project

## Select

- The SELECT operation is used to choose a subset of the tuples from a relation that satisfies a selection condition.
- One can consider the SELECT operation to be a filter that keeps only those tuples that satisfy a qualifying condition.
- In general, the SELECT operation is denoted by
- $\sigma<$ selection condition $>(R)$
- where the symbol $\sigma$ (sigma) is used to denote the SELECT operator
- The selection condition is a Boolean expression (condition) specified on the attributes of relation $R$.

## Select

- For example, to select the EMPLOYEE tuples whose department is 4 , or those whose salary is greater than $\$ 30,000$, we can individually specify each of these two conditions with a SELECT operation as follows:
- $\sigma$ Dno=4(EMPLOYEE)
- $\sigma$ Salary>30000(EMPLOYEE)

## Project

- If we think of a relation as a table, The PROJECT operation, selects certain columns from the table and discards the other columns.
- If we are interested in only certain attributes of a relation, we use the PROJECT operation to project the relation over these attributes only.
- The general form of the PROJECT operation is
- $\pi<$ attribute list>( $R$ )
- where $\pi$ (pi) is the symbol used to represent the PROJECT operation, and <attribute list> is the desired sublist of attributes from the attributes of relation $R$.

## Project

- For example, to list each employee's first and last name and salary, we can use the PROJECT operation as follows:
- $\pi$ Lname, Fname, Salary(EMPLOYEE)
- If the attribute list includes only nonkey attributes of $R$, duplicate tuples are likely to occur.
- The PROJECT operation removes any duplicate tuples, so the result of the PROJECT operation is a set of distinct tuples, and hence a valid relation.
- This is known as duplicate elimination.

## Project

Results of SELECT and PROJECT operations. (a) $\sigma_{(\text {Dno }=4 ~ A N D ~ S a l a r y ~}^{25000)}$ ) OR (Dno $=5$ AND Salary $>30000$ ) (EMPLOYEE). (b) $\pi_{\text {Lname, Fname, Salary }}$ (EMPLOYEE). (c) $\pi_{\text {Sex, Salary }}$ (EMPLOYEE).

| Borg | James | 55000 |

(c)

| Sex | Salary |
| :---: | :---: |
| M | 30000 |
| M | 40000 |
| F | 25000 |
| F | 43000 |
| M | 38000 |
| M | 25000 |
| M | 55000 |

## Binary Operators

- Union, Intersection
- Set Difference
- Cartesian Product

## UNION

- The result of this operation, denoted by $R \cup S$, is a relation that includes all tuples that are either in $R$ or in $S$ or in both $R$ and $S$.
- Duplicate tuples are eliminated.
- Union is Commutative:

$$
R \cup S=S \cup R
$$

## UNION

RESULT1

| Ssn |
| :---: |
| 123456789 |
| 333445555 |
| 666884444 |
| 453453453 |

RESULT2

| Ssn |
| :---: |
| 333445555 |
| 888665555 |

RESULT

| Ssn |
| :---: |
| 123456789 |
| 333445555 |
| 666884444 |
| 453453453 |
| 888665555 |

Result of the UNION operation RESULT $\leftarrow$ RESULT1 $\cup$ RESULT2.

## INTERSECTION

- The result of this operation, denoted by $R \cap S$, is a relation that includes all tuples that are in both $R$ and $S$.
- Intersection is Commutative

$$
R \cap S=S \cap R
$$

STUDENT $\cap$ INSTRUCTOR

## Set Difference(Minus)

- The result of this operation, denoted by $R-S$, is a relation that includes all tuples that are in $R$ but not in $S$.
- The MINUS operation is not commutative; that is, in general,
- $R-S \neq S-R$

## Cartesian Product

- The CARTESIAN PRODUCT operation-also known as CROSS PRODUCT or CROSS JOIN—which is denoted by $\times$.
- If $R$ has $C$ tuples and $S$ has $D$ tuples, the result is $C^{*} D$ tuples.
- Example:
- FEMALE_EMPS $\leftarrow \sigma S e x={ }^{\prime} F^{\prime}(E M P L O Y E E)$
- EMPNAMES $\leftarrow \pi$ Fname, Lname, Ssn(FEMALE_EMPS)
- EMP_DEPENDENTS $\leftarrow E M P N A M E S \times$ DEPENDENT
- ACTUAL_DEPENDENTS $\leftarrow \sigma$ Ssn=Essn(EMP_DEPENDENTS)
- RESULT $\leftarrow \pi$ Fname, Lname, Dependent_name(ACTUAL_DEPENDENTS)

## Cartesian Product

## FEMALE EMPS

| Fname | Minit | Lname | Ssn | Bdate | Address | Sex | Salary | Super_ssn | Dno |
