

The background features a dark blue gradient with faint, light blue technical diagrams. On the left, there is a large circular scale with numerical markings from 40 to 260 in increments of 10. Several circular gauges and dashed lines with arrows are scattered across the scene, suggesting a data analysis or engineering context.

# DATA WAREHOUSING

DEPARTMENT OF COMPUTER SCIENCE  
IQRA NATIONAL UNIVERSITY

# DATA WAREHOUSE

- A data warehouse (DW or DWH), also known as an enterprise data warehouse (EDW), is a system used for reporting and data analysis.
- DWH is considered a core component of business intelligence.
- DWHs are central repositories of integrated data from one or more disparate sources.

# HISTORICAL OVERVIEW

- 1960

Master Files & Reports

- 1965

Lots of Master files!

- 1970

Direct Access Memory & DBMS

- 1975

Online high performance transaction processing

# HISTORICAL OVERVIEW

- 1980  
PCs and 4GL Technology (MIS/DSS)
- 1985 & 1990  
Extract programs, extract processing,  
The legacy system's web.

# WHY DATA WAREHOUSE?

- In the 1990s, businesses grew more complex, corporations spread globally, and competition became fiercer.
- The operational computer systems did provide information to run the day-to-day operations, but what the executives needed were different kinds of information that could be readily used to make strategic decisions.
- The operational systems, important as they were, could not provide strategic information.

# WHY DATA WAREHOUSE?

- Businesses, therefore, were compelled to turn to new ways of getting strategic information.
- Data warehousing is a new paradigm specifically intended to provide vital strategic information.
- In the 1990s, organizations began to achieve competitive advantage by building data warehouse systems.
- Figure shows a sample of strategic areas where data warehousing is already producing results in different industries.

# ORGANIZATION'S USE OF DATA WAREHOUSING

- ◆ Retail
  - ◆ Customer Loyalty
  - ◆ Market Planning
- ◆ Financial
  - ◆ Risk Management
  - ◆ Fraud Detection
- ◆ Airlines
  - ◆ Route Profitability
  - ◆ Yield Management

- ◆ Manufacturing
  - ◆ Cost Reduction
  - ◆ Logistics Management
- ◆ Utilities
  - ◆ Asset Management
  - ◆ Resource Management
- ◆ Government
  - ◆ Manpower Planning
  - ◆ Cost Control

# ESCALATING NEED FOR STRATEGIC INFORMATION

- The executives and managers who are responsible for keeping the enterprise competitive need strategic information to make proper decisions.
- Strategic information is information to formulate the business strategies, establish goals, set objectives, and monitor results.
- Some examples of business objectives are:
  - Retain the present customer base
  - Increase the customer base by 15% over the next 5 years
  - Improve product quality levels in the top five product groups
  - Bring three new products to market in 2 years
  - Increase sales by 15% in the North East Division

# ESCALATING NEED FOR STRATEGIC INFORMATION

- For making decisions about these business objectives, executives and managers need in-depth knowledge of their company's operations, learn about the key business factors and how these affect one another.
- Strategic information is not intended to produce an invoice, make a shipment, settle a claim, or post a withdrawal from a bank account.
- Strategic information is far more important for the continued health and survival of the corporation. Critical business decisions depend on the availability of proper strategic information in an enterprise.

# CHARACTERISTICS OF STRATEGIC INFORMATION

<b>INTEGRATED</b>	Must have a single, enterprise-wide view.
<b>DATA INTEGRITY</b>	Information must be accurate and must conform to business rules.
<b>ACCESSIBLE</b>	Easily accessible with intuitive access paths, and responsive for analysis.
<b>CREDIBLE</b>	Every business factor must have one and only one value.
<b>TIMELY</b>	Information must be available within the stipulated time frame.

# INFORMATION CRISIS

- We are faced with two startling facts:
  - Organizations have lots of data;
  - Information technology resources and systems are not effective at turning all that data into useful strategic information.
- Most companies are faced with an information crisis not because of lack of sufficient data, but because the available data is not readily usable for strategic decision making.
- The reason is the data of an enterprise is spread across many types of incompatible structures and systems.

# TECHNOLOGY TRENDS

- Size of Data Sets are going up ↑.
- Cost of data storage is coming down ↓.
  - The amount of data average business collects and stores is doubling every year.
  - Total hardware and software cost to store and manage 1 Mbyte of data
    - 1990: ~ \$15
    - 2002: ~ ¢15 (Down 100 times)
    - By 2007: < ¢1 (Down 150 times)

# TECHNOLOGY TRENDS

- But size is not everything!
- Businesses demand Intelligence (BI).
  - Complex questions from integrated data.
  - “Intelligent Enterprise” or “Strategic Information”.

# DBMS APPROACH

- List of all items that were sold last month?
- List of all items purchased by Tariq Majeed?
- The total sales of the last month grouped by branch?
- How many sales transactions occurred during the month of January?

# STRATEGIC INFORMATION

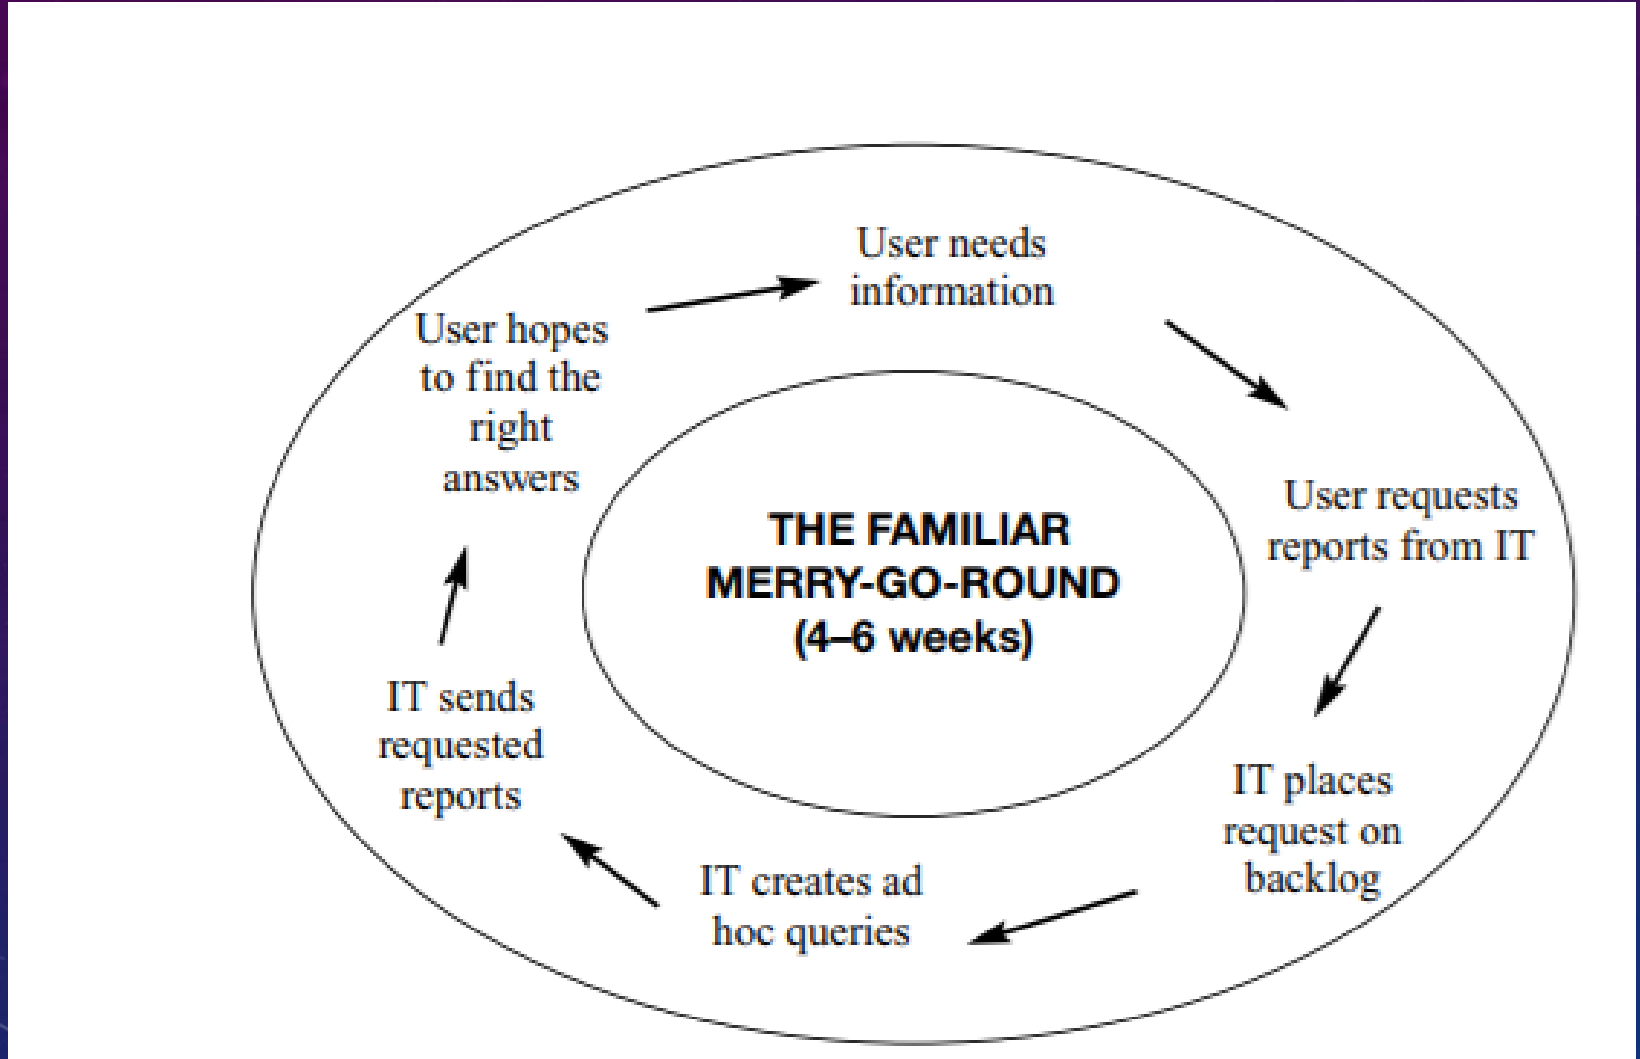

- Which items sell together? Which items to stock?
- Where and how to place the items? What discounts to offer?
- How best to target customers to increase sales at a branch?
- Which customers are most likely to respond to my next promotional campaign, and why?

# OPERATIONAL VERSUS DECISION-SUPPORT SYSTEMS

- All the past attempts by IT to provide strategic information have been failures.
- This was mainly because IT has been trying to provide strategic information from operational systems.
- These operational systems such as order processing, inventory control, claims processing, outpatient billing, and so on are not designed or intended to provide strategic information.
- Only specially designed decision support systems or informational systems can provide strategic information.

# OPERATIONAL VERSUS DECISION-SUPPORT SYSTEMS

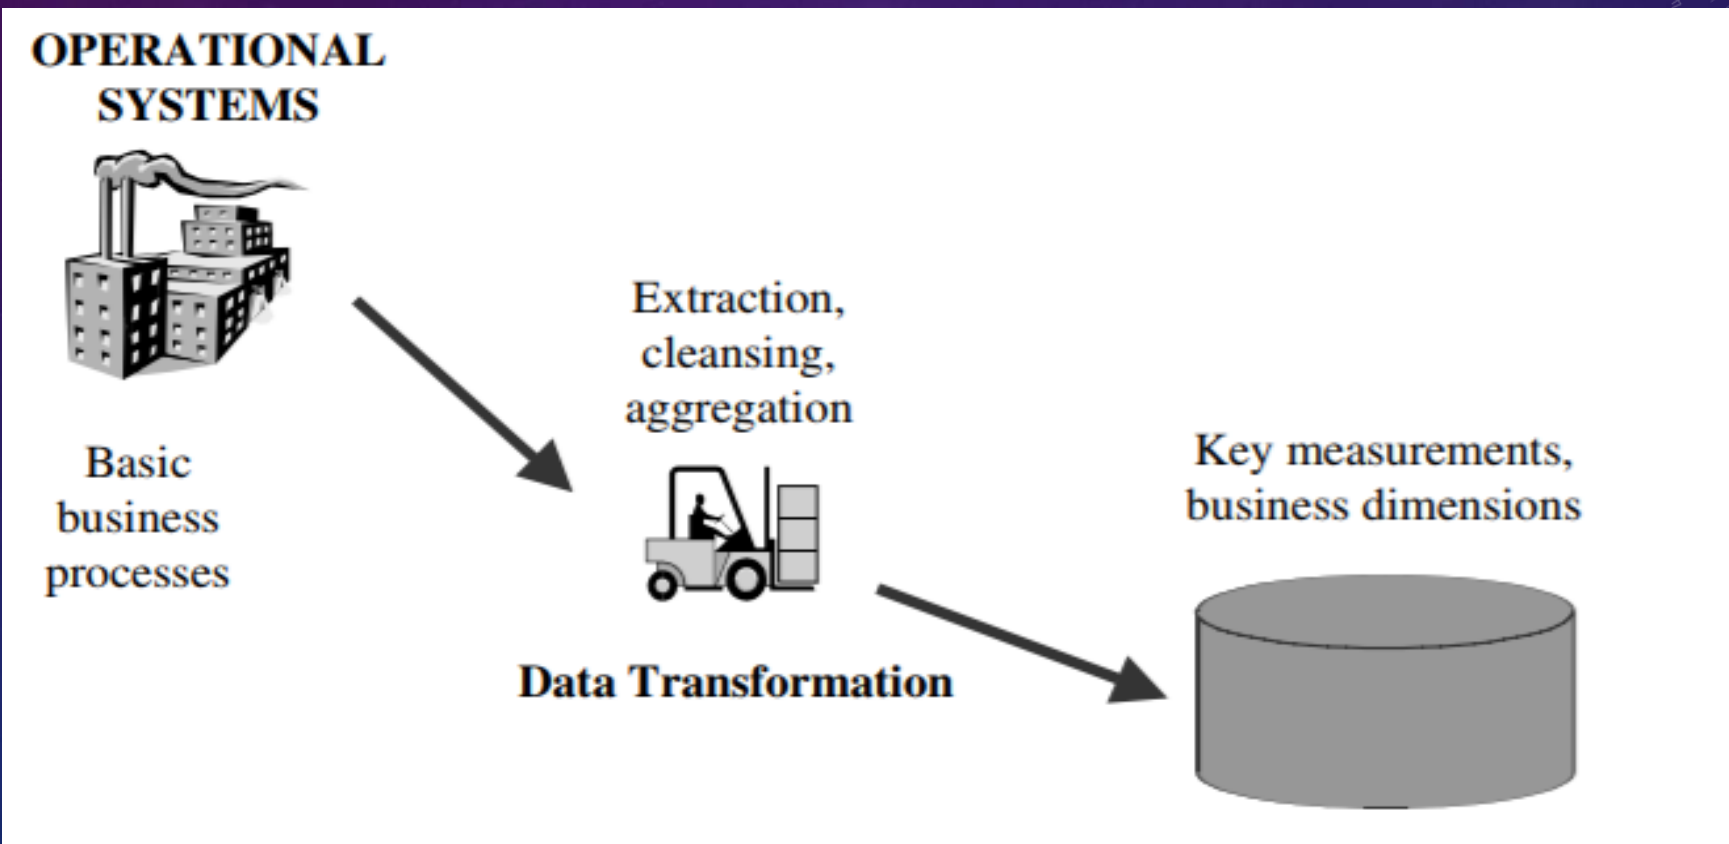

Inadequate attempts by IT to provide strategic information

# OPERATIONAL VERSUS DECISION-SUPPORT SYSTEMS

Figure summarizes the differences between the traditional operational systems and the newer informational/Decision Support systems that need to be built.

	<b>OPERATIONAL</b>	<b>INFORMATIONAL</b>
<b>Data Content</b>	Current values	Archived, derived, summarized
<b>Data Structure</b>	Optimized for transactions	Optimized for complex queries
<b>Access Frequency</b>	High	Medium to low
<b>Access Type</b>	Read, update, delete	Read
<b>Usage</b>	Predictable, repetitive	Ad hoc, random, heuristic
<b>Response Time</b>	Sub-seconds	Several seconds to minutes
<b>Users</b>	Large number	Relatively small number

# BUSINESS INTELLIGENCE AT THE DATA WAREHOUSE

# DATA WAREHOUSE DEFINED

- The Data warehouse is thus the decision support system that can provide strategic information for analysis, discerning trends, and monitoring performance. The DWH
  - Provides an integrated and total view of the enterprise.
  - Makes the enterprise's current and historical information easily available for decision making.
  - Renders the organization's information consistent.
  - Presents a flexible and interactive source of strategic information.

# PROCESSING REQUIREMENTS IN DATA WAREHOUSE

Most of the processing in DWH for strategic information will have to be analytical. There are four levels of analytical processing requirements:

- Running of simple queries and reports against current and historical data
- Ability to perform “what if” analysis in many different ways.
- Ability to query, step back, analyze, and then continue the process to any desired length.
- Spot historical trends and apply them for future results.

# A BLEND OF MANY TECHNOLOGIES

Let us re-examine the basic concept of data warehousing. The basic concept of data warehousing is:

- Take all the data from the operational systems
- Where necessary, include relevant data from outside, such as industry benchmark indicators
- Integrate all the data from the various sources
- Remove inconsistencies and transform the data
- Store the data in formats suitable for easy access for decision making
- Although a simple concept, it involves different functions: data extraction, the function of loading the data, transforming the data, storing the data, and providing user interfaces.

# DEFINING FEATURES OF DATA WAREHOUSE

- Subject-Oriented Data
- Integrated Data
- Time-variant Data
- Nonvolatile Data
- Data Granularity

# SUBJECT-ORIENTED DATA

- In operational systems, data is stored by individual applications.
- In the data warehouse, data is stored by business subjects, not by applications.
- Business subjects differ from enterprise to enterprise.
- These are the subjects critical for the enterprise.
- For a manufacturing company, sales, shipments, and inventory are critical business subjects.
- For a retail store, sales at the check-out counter is a critical subject.
- Figure distinguishes between how data is stored in operational systems and in the data warehouse.

# SUBJECT-ORIENTED DATA

## Operational Applications

Order  
Processing

Consumer  
Loans

Customer  
Billing

Accounts  
Receivable

Claims  
Processing

Savings  
Accounts

## Data Warehouse Subjects

Sales

Product

Customer

Account

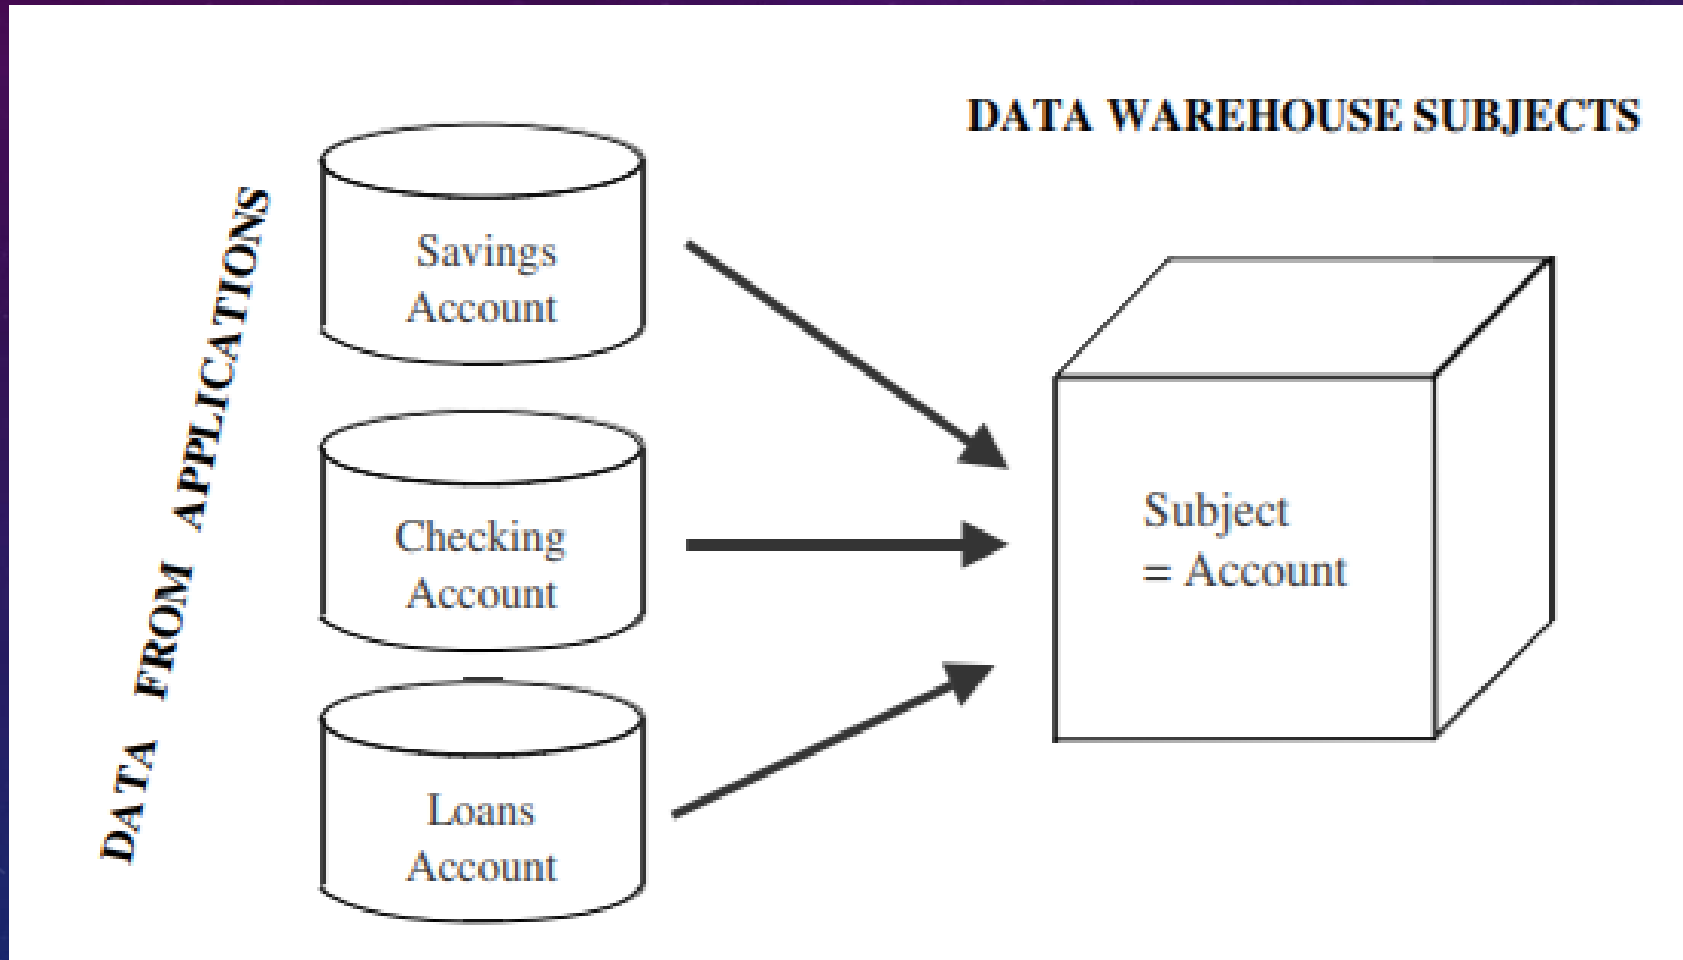

Claims

Policy

# INTEGRATED DATA

- The data in the data warehouse comes from several operational systems.
- Source data are in different databases, so the file layouts, character code representations could be different, naming conventions could be different, attributes for data items could be different.
- Before the data from various disparate sources can be usefully stored in a data warehouse, data inconsistencies are removed; data from diverse operational applications is integrated.

# INTEGRATED DATA

# TIME-VARIANT DATA

- For an operational system, the stored data contains the current values.
- we might store some past transactions in operational systems, but, essentially, operational systems reflect current information because these systems support day-to-day current operations.
- A data warehouse, because of the very nature of its purpose, has to contain historical data, not just current values.
- For example, if a user wants to find out the reason for the drop in sales in the North East division, the user needs all the sales data for that division over a period extending back in time.

# TIME-VARIANT DATA

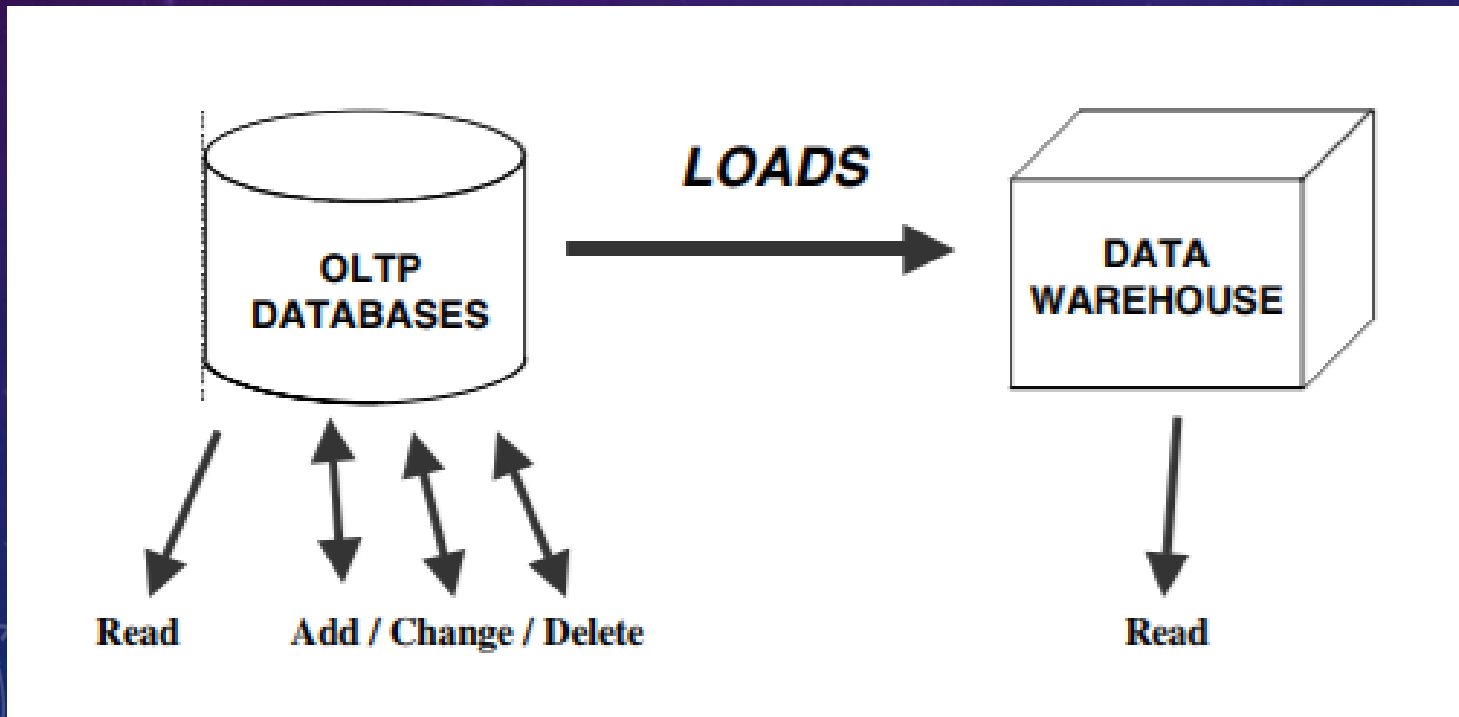

- When an analyst in a grocery chain wants to promote two or more products together, that analyst wants sales of the selected products over a number of past quarters.
- The time-variant nature of the data in a data warehouse:
  - Allows for analysis of the past
  - Relates information to the present
  - Enables forecasts for the future

# NONVOLATILE DATA

- Data extracted from the various operational systems and pertinent data obtained from outside sources are transformed, integrated, and stored in the data warehouse.
- The data in the data warehouse is not intended to run the day-to-day business.
- Data from the operational systems are moved into the data warehouse at specific intervals. We do not update the data warehouse every time we process a single order.
- Depending on the requirements of the business, these data movements take place twice a day, once a day, once a week, or once in two weeks.

# NONVOLATILE DATA

As illustrated in Figure, every business transaction does not update the data in the data warehouse. The business transactions update the operational system databases in real time.

# DATA GRANULARITY

- In an operational system, data is usually kept at the lowest level of detail.
- We do not usually keep summary data in an operational system.
- Frequently, the analysis begins at a high level and moves down to lower levels of detail.
- Data granularity refers to the level of detail. Depending on the requirements, multiple levels of detail may be present. Many data warehouses have at least dual levels of granularity.

# DATA GRANULARITY

## THREE DATA LEVELS IN A BANKING DATA WAREHOUSE

### Daily Detail

Account

Activity Date

Amount

Deposit/Withdrawal

### Monthly Summary

Account

Month

Number of transactions

Withdrawals

Deposits

Beginning Balance

Ending Balance

### Quarterly Summary

Account

Month

Number of transactions
